INTERNATIONAL STANDARDS AND RECOMMENDED PRACTICES

OPERATION OF AIRCRAFT

ANNEX 6

TO THE CONVENTION ON INTERNATIONAL CIVIL AVIATION

PART II

INTERNATIONAL GENERAL AVIATION — AEROPLANES

SIXTH EDITION OF PART II — JULY 1998

This edition incorporates all amendments adopted by the Council prior to 21 March 1998 and supersedes, on 5 November 1998, all previous editions of Part II of Annex 6.

For information regarding the applicability of the Standards and Recommended Practices, see Foreword.

INTERNATIONAL CIVIL AVIATION ORGANIZATION
The issue of amendments is announced regularly in the *ICAO Journal* and in the monthly *Supplement to the Catalogue of ICAO Publications and Audio-visual Training Aids*, which holders of this publication should consult. The space below is provided to keep a record of such amendments.

INTERNATIONAL GENERAL AVIATION — AEROPLANES

FOREWORD

Historical background

Standards and Recommended Practices for the Operation of Aircraft — International General Aviation were first adopted by the Council on 2 December 1968 pursuant to the provisions of Article 37 of the Convention on International Civil Aviation (Chicago, 1944) and designated as Annex 6, Part II, to the Convention. They became effective on 2 April 1969 and applicable on 18 September 1969.

Annex 6, Part II, was developed in the following manner: the Fifteenth Session of the Assembly, Montreal, June-July 1965, adopted Resolution A15-15: “Consideration of the needs of international general aviation in relation to the scope of ICAO technical activities”. Subsequently, the Fourth Air Navigation Conference (Montreal, November-December 1965) recommended a series of factors which it considered should be taken into account in extending the scope of Annex 6 to meet the needs of general aviation in accordance with the directives of Assembly Resolution A15-15.

The Fourth Air Navigation Conference recommended that the International Standards and Recommended Practices to be developed for International General Aviation Operations exclude for the present aerial work operations. It was however clearly the view of the conference that the Annex should be framed in such a manner as to facilitate its extension to cover aerial work operations at a later date, should such extension prove desirable.

Based on the above considerations, draft International Standards and Recommended Practices for the Operation of International General Aviation Aircraft were developed by the Air Navigation Commission and, after amendment following the usual consultation with the Member States of the Organization, were adopted by the Council so as to become, together with the Foreword approved by the Council, the text of this Annex. In developing this material the Air Navigation Commission was guided by the following philosophies:

_Presentation and conformity with Annex 6, Part I._ The Annex should be, as nearly as practicable, equivalent in scope and conform as closely as possible to Annex 6 (now Annex 6, Part I).

Applicability. Although the definition of general aviation originally used in this Annex encompassed aerial work operations, these were specifically excluded from the provisions of this Annex by Chapter 2 — Applicability.

_Level of safety._ The Annex should ensure an acceptable level of safety to third parties (third parties meaning persons on the ground and persons in the air in other aircraft). Also, as some international general aviation operations will be performed:

- a) by crews less experienced and less skilled;
- b) by less reliable equipment;
- c) to less rigorous standards; and
- d) with greater freedom of action than in commercial air transport operations;

it has to be accepted that the passenger in international general aviation aircraft will not necessarily enjoy the same level of safety as the fare-paying passenger in commercial air transport. However, it was recognized that in ensuring an acceptable degree of safety for third parties, an acceptable level of safety for flight crews and passengers would be achieved.

_Freedom of Action._ The maximum freedom of action consistent with maintaining an acceptable level of safety should be granted to international general aviation.

_Responsibility._ The responsibility that devolves upon the operator in Annex 6, Part I, should, in Part II of the Annex, fall upon the pilot-in-command. Precedent for this course of action exists in Annex 2.

Consequent to the adoption of Annex 6, Part III, _International Operations — Helicopters_, an amendment to the title was introduced to indicate that Annex 6, Part II was applicable only to aeroplanes.

In 1986 the Air Navigation Commission commenced a review of Annex 6, Part II and concluded that the definition of general aviation should be revised to exclude aerial work thus recognizing that aerial work was a distinct aspect of civil aviation and recognizing the exclusion of aerial work from the applicability of Annex 6, Part II. As with the Fourth Air Navigation Conference in 1965, the Air Navigation
Commission was not aware of any degree of international aerial work operations which would necessitate the development of International Standards and Recommended Practices. The revised definitions for general aviation and aerial work and the revised applicability chapter were submitted to States in the usual manner and approved by the Council in March 1990.

Table A shows the origin of amendments together with a list of the principal subjects involved and the dates on which the Annex and the amendments were adopted by the Council, when they became effective and when they became applicable.

**Applicability**

The Standards and Recommended Practices of Annex 6, Part II are applicable to international general aviation operations with aeroplanes.

The Standards and Recommended Practices represent minimum provisions and, together with those of Annex 6 — Operation of Aircraft: Part I — International Commercial Air Transport — Aeroplanes, now cover the operation of all aeroplanes in international civil aviation, except in aerial work operations.

It will be noted that the Standards and Recommended Practices contained in Annex 6, Part II, when applied to the operation of large aeroplanes, are less stringent than those in Annex 6, Part I, applicable to the same or similar aeroplanes when used in commercial air transport operations. Nevertheless, it is considered that, in conjunction with existing provisions in Annexes 1 and 8, Annex 6, Part II, ensures an adequate level of safety for the operations envisaged for the large aeroplanes in question. In this connexion attention is drawn to the point that the entire performance standards of Annex 8 are applicable to all aeroplanes of over 5 700 kg mass intended for the carriage of passengers or cargo or mail for international air navigation, of which the prototype was submitted for certification on or after 13 December 1964. Moreover, by virtue of Annex 1 the holder of a private pilot licence, piloting an aircraft in excess of 5 700 kg unless as the sole occupant thereof is required to have a type rating entered on his licence. Since the certificates of airworthiness of the types of aeroplanes in question would preclude solo flight in all normal circumstances, it may be accepted that the private pilot of these aeroplanes must have a type rating entered on his licence.

**Action by Contracting States**

**Notification of differences.** The attention of Contracting States is drawn to the obligation imposed by Article 38 of the Convention by which Contracting States are required to notify the Organization of any differences between their national regulations and practices and the International Standards contained in this Annex and any amendments thereto. Contracting States are invited to extend such notification to any differences from the Recommended Practices contained in this Annex, and any amendments thereto, when the notification of such differences is important for the safety of air navigation. Further, Contracting States are invited to keep the Organization currently informed of any differences which may subsequently occur, or of the withdrawal of any differences previously notified. A specific request for notification of differences will be sent to Contracting States immediately after the adoption of each amendment to this Annex.

The attention of States is also drawn to the provision of Annex 15 related to the publication of differences between their national regulations and practices and the related ICAO Standards and Recommended Practices through the Aeronautical Information Service, in addition to the obligation of States under Article 38 of the Convention.

**Prolongation of information.** The establishment and withdrawal of and changes to facilities, services and procedures affecting aircraft operations provided in accordance with the Standards and Recommended Practices specified in this Annex should be notified and take effect in accordance with the provisions of Annex 15.

**Status of Annex components**

An Annex is made up of the following component parts, not all of which, however, are necessarily found in every Annex; they have the status indicated:

1.—Material comprising the Annex proper:

   a) **Standards and Recommended Practices** adopted by the Council under the provisions of the Convention. They are defined as follows:

      **Standard:** Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as necessary for the safety or regularity of international air navigation and to which Contracting States will conform in accordance with the Convention; in the event of impossibility of compliance, notification to the Council is compulsory under Article 38.

      **Recommended Practice:** Any specification for physical characteristics, configuration, matériel, performance, personnel or procedure, the uniform application of which is recognized as desirable in the interest of safety, regularity or efficiency of international air navigation, and to which Contracting States will endeavour to conform in accordance with the Convention.
b) **Appendices** comprising material grouped separately for convenience but forming part of the Standards and Recommended Practices adopted by the Council.

c) **Definitions** of terms used in the Standards and Recommended Practices which are not self-explanatory in that they do not have accepted dictionary meanings. A definition does not have independent status but is an essential part of each Standard and Recommended Practice in which the term is used, since a change in the meaning of the term would affect the specification.

d) **Tables** and **Figures** which add to or illustrate a Standard or Recommended Practice and which are referred to therein, form part of the associated Standard or Recommended Practice and have the same status.

It is to be noted that some Standards in this Annex incorporate, by reference, other specifications having the status of Recommended Practices. In such cases, the text of the Recommended Practice becomes part of the Standard.

2.— **Material approved by the Council for publication in association with the Standards and Recommended Practices:**

a) **Forewords** comprising historical and explanatory material based on the action of the Council and including an explanation of the obligations of States with regard to the application of the Standards and Recommended Practices ensuing from the Convention and the Resolution of Adoption;

b) **Introductions** comprising explanatory material introduced at the beginning of parts, chapters or sections of the Annex to assist in the understanding of the application of the text;

c) **Notes** included in the text, where appropriate, to give factual information or references bearing on the Standards or Recommended Practices in question, but not constituting part of the Standards or Recommended Practices;

d) **Attachments** comprising material supplementary to the Standards and Recommended Practices, or included as a guide to their application.

**Selection of language**

This Annex has been adopted in six languages — English, Arabic, Chinese, French, Russian and Spanish. Each Contracting State is requested to select one of those texts for the purpose of national implementation and for other effects provided for in the Convention, either through direct use or through translation into its own national language, and to notify the Organization accordingly.

**Editorial practices**

The following practice has been adhered to in order to indicate at a glance the status of each statement: **Standards** have been printed in light face roman; **Recommended Practices** have been printed in light face italics, the status being indicated by the prefix **Recommendation**; **Notes** have been printed in light face italics, the status being indicated by the prefix **Note**.

The following editorial practice has been followed in the writing of specifications: for Standards the operative verb “shall” is used, and for Recommended Practices the operative verb “should” is used.

The units of measurement used in this document are in accordance with the International System of Units (SI) as specified in Annex 5 to the Convention on International Civil Aviation. Where Annex 5 permits the use of non-SI alternative units these are shown in parentheses following the basic units. Where two sets of units are quoted it must not be assumed that the pairs of values are equal and interchangeable. It may, however, be inferred that an equivalent level of safety is achieved when either set of units is used exclusively.

Any reference to a portion of this document, which is identified by a number and/or title, includes all subdivisions of that portion.

CHAPTER 1. DEFINITIONS

When the following terms are used in the Standards, Recommended Practices and Definitions for the operation of aeroplanes in international general aviation, they have the following meanings:

**Aerial work.** An aircraft operation in which an aircraft is used for specialized services such as agriculture, construction, photography, surveying, observation and patrol, search and rescue, aerial advertisement, etc.

**Aerodrome.** A defined area on land or water (including any buildings, installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of aircraft.

**Aerodrome operating minima.** The limits of usability of an aerodrome for:

- a) take-off, expressed in terms of runway visual range and/or visibility and, if necessary, cloud conditions;
- b) landing in precision approach and landing operations, expressed in terms of visibility and/or runway visual range and decision altitude/height (DA/H) as appropriate to the category of the operation;
- c) landing in approach and landing operations with vertical guidance, expressed in terms of visibility and/or runway visual range and decision altitude/height (DA/H); and
- d) landing in non-precision approach and landing operations, expressed in terms of visibility and/or runway visual range, minimum descent altitude/height (MDA/H) and, if necessary, cloud conditions.

**Aeroplane.** A power-driven heavier-than-air aircraft, deriving its lift in flight chiefly from aerodynamic reactions on surfaces which remain fixed under given conditions of flight.

**Aircraft.** Any machine that can derive support in the atmosphere from the reactions of the air other than the reactions of the earth’s surface.

**Alternate aerodrome.** An aerodrome to which an aircraft may proceed when it becomes either impossible or inadvisable to proceed to or to land at the aerodrome of intended landing. Alternate aerodromes include the following:

- **Take-off alternate.** An alternate aerodrome at which an aircraft can land should this become necessary shortly after take-off and it is not possible to use the aerodrome of departure.
- **En-route alternate.** An aerodrome at which an aircraft would be able to land after experiencing an abnormal or emergency condition while en route.
- **Destination alternate.** An alternate aerodrome to which an aircraft may proceed should it become either impossible or inadvisable to land at the aerodrome of intended landing.

Note.— The aerodrome from which a flight departs may also be an en-route or a destination alternate aerodrome for that flight.

**Approach and landing operations using instrument approach procedures.** Instrument approach and landing operations are classified as follows:

- **Non-precision approach and landing operations.** An instrument approach and landing which utilizes lateral guidance but does not utilize vertical guidance.
- **Approach and landing operations with vertical guidance.** An instrument approach and landing which utilizes lateral and vertical guidance but does not meet the requirements established for precision approach and landing operations.
- **Precision approach and landing operations.** An instrument approach and landing using precision lateral and vertical guidance with minima as determined by the category of operation.

Note.— Lateral and vertical guidance refers to the guidance provided either by:

- a) a ground-based navigation aid; or
- b) computer generated navigation data.

**Categories of precision approach and landing operations:**

- **Category I (CAT I) operation.** A precision instrument approach and landing with a decision height not lower than 60 m (200 ft) and with either a visibility not less than 800 m or a runway visual range not less than 550 m.
Category II (CAT II) operation. A precision instrument approach and landing with a decision height lower than 60 m (200 ft), but not lower than 30 m (100 ft), and a runway visual range not less than 350 m.

Category IIIA (CAT IIIA) operation. A precision instrument approach and landing with:

a) a decision height lower than 30 m (100 ft) or no decision height; and

b) a runway visual range not less than 200 m.

Category IIIB (CAT IIIB) operation. A precision instrument approach and landing with:

a) a decision height lower than 15 m (50 ft) or no decision height; and

b) a runway visual range less than 200 m but not less than 50 m.

Category IIIC (CAT IIIC) operation. A precision instrument approach and landing with no decision height and no runway visual range limitations.

Note.— Where decision height (DH) and runway visual range (RVR) fall into different categories of operation, the instrument approach and landing operation would be conducted in accordance with the requirements of the most demanding category (e.g. an operation with a DH in the range of CAT IIIA but with an RVR in the range of CAT IIIB would be considered a CAT IIIB operation or an operation with a DH in the range of CAT II but with an RVR in the range of CAT I would be considered a CAT II operation).

Commercial air transport operation. An aircraft operation involving the transport of passengers, cargo or mail for remuneration or hire.

Dangerous goods. Articles or substances which are capable of posing a risk to health, safety, property or the environment and which are shown in the list of dangerous goods in the Technical Instructions or which are classified according to those Instructions.

Note.— Dangerous goods are classified in Annex 18, Chapter 3.

Decision altitude (DA) or decision height (DH). A specified altitude or height in the precision approach or approach with vertical guidance at which a missed approach must be initiated if the required visual reference to continue the approach has not been established.

Note 1.— Decision altitude (DA) is referenced to mean sea level and decision height (DH) is referenced to the threshold elevation.

Note 2.— The required visual reference means that section of the visual aids or of the approach area which should have been in view for sufficient time for the pilot to have made an assessment of the aircraft position and rate of change of position, in relation to the desired flight path. In Category III operations with a decision height the required visual reference is that specified for the particular procedure and operation.

Note 3.— For convenience where both expressions are used they may be written in the form “decision altitude/height” and abbreviated “DA/H”.

Emergency locator transmitter (ELT). A generic term describing equipment which broadcast distinctive signals on designated frequencies and, depending on application, may be automatically activated by impact or be manually activated. An ELT may be any of the following:

Automatic fixed ELT (ELT(AF)). An automatically activated ELT which is permanently attached to an aircraft.

Automatic portable ELT (ELT(AP)). An automatically activated ELT which is rigidly attached to an aircraft but readily removable from the aircraft.

Automatic deployable ELT (ELT(AD)). An ELT which is rigidly attached to an aircraft and which is automatically deployed and activated by impact, and, in some cases, also by hydrostatic sensors. Manual deployment is also provided.

Survival ELT (ELT(S)). An ELT which is removable from an aircraft, stowed so as to facilitate its ready use in an emergency, and manually activated by survivors.

Flight crew member. A licensed crew member charged with duties essential to the operation of an aircraft during a flight duty period.

Flight manual. A manual, associated with the certificate of airworthiness, containing limitations within which the aircraft is to be considered airworthy, and instructions and information necessary to the flight crew members for the safe operation of the aircraft.

Flight plan. Specified information provided to air traffic services units, relative to an intended flight or portion of a flight of an aircraft.

Flight recorder. Any type of recorder installed in the aircraft for the purpose of complementing accident/incident investigation.

Flight time — aeroplanes. The total time from the moment an aeroplane first moves for the purpose of taking off until the moment it finally comes to rest at the end of the flight.

Note.— Flight time as here defined is synonymous with the term “block to block” time or “chock to chock” time in
general usage which is measured from the time an aeroplane first moves for the purpose of taking off until it finally stops at the end of the flight.

**General aviation operation.** An aircraft operation other than a commercial air transport operation or an aerial work operation.

**Instrument meteorological conditions (IMC).** Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling*, less than the minima specified for visual meteorological conditions.

*Note.— The specified minima for visual meteorological conditions are contained in Chapter 4 of Annex 2.*

**Maintenance.** The performance of tasks required to ensure the continuing airworthiness of an aircraft, including any one or combination of overhaul, inspection, replacement, defect rectification, and the embodiment of a modification or repair.

**Maintenance programme.** A document which describes the specific scheduled maintenance tasks and their frequency of completion and related procedures, such as a reliability programme, necessary for the safe operation of those aircraft to which it applies.

**Maintenance release.** A document which contains a certification confirming that the maintenance work to which it relates has been completed in a satisfactory manner, either in accordance with the approved data and the procedures described in the maintenance organization’s procedures manual or under an equivalent system.

**Meteorological information.** Meteorological report, analysis, forecast, and any other statement relating to existing or expected meteorological conditions.

**Minimum descent altitude (MDA) or minimum descent height (MDH).** A specified altitude or height in a non-precision approach or circling approach below which descent must not be made without the required visual reference.

**Note 1.— Minimum descent altitude (MDA) is referenced to mean sea level and minimum descent height (MDH) is referenced to the aerodrome elevation or to the threshold elevation if that is more than 2 m (7 ft) below the aerodrome elevation. A minimum descent height for a circling approach is referenced to the aerodrome elevation.**

**Note 2.— The required visual reference means that section of the visual aids or of the approach area which should have been in view for sufficient time for the pilot to have made an assessment of the aircraft position and rate of change of position, in relation to the desired flight path. In the case of a circling approach the required visual reference is the runway environment.**

**Note 3.— For convenience when both expressions are used they may be written in the form “minimum descent altitude/height” and abbreviated “MDA/H”.*

**Night.** The hours between the end of evening civil twilight and the beginning of morning civil twilight or such other period between sunset and sunrise, as may be prescribed by the appropriate authority.

**Obstacle clearance altitude (OCA) or obstacle clearance height (OCH).** The lowest altitude or the lowest height above the elevation of the relevant runway threshold or the aerodrome elevation as applicable, used in establishing compliance with appropriate obstacle clearance criteria.

**Note 1.— Obstacle clearance altitude is referenced to mean sea level and obstacle clearance height is referenced to the threshold elevation or in the case of non-precision approaches to the aerodrome elevation or the threshold elevation if that is more than 2 m (7 ft) below the aerodrome elevation. An obstacle clearance height for a circling approach is referenced to the aerodrome elevation.**

**Note 2.— For convenience when both expressions are used they may be written in the form “obstacle clearance altitude/height” and abbreviated “OCA/H”.*

**Pilot-in-command.** The pilot designated by the operator, or in the case of general aviation, the owner, as being in command and charged with the safe conduct of a flight.

**Psychoactive substances.** Alcohol, opioids, cannabinoids, sedatives and hypnotics, cocaine, other psychostimulants, hallucinogens, and volatile solvents, whereas coffee and tobacco are excluded.

**Repair.** The restoration of an aeronautical product to an airworthy condition to ensure that the aircraft continues to comply with the design aspects of the appropriate airworthiness requirements used for the issuance of the type certificate for the respective aircraft type, after it has been damaged or subjected to wear.

**Required navigation performance (RNP).** A statement of the navigation performance necessary for operation within a defined airspace.

*Note.— Navigation performance and requirements are defined for a particular RNP type and/or application.*

*As defined in Annex 2.*
**RNP type.** A containment value expressed as a distance in nautical miles from the intended position within which flights would be for at least 95 per cent of the total flying time.

Example.— RNP 4 represents a navigation accuracy of plus or minus 7.4 km (4 NM) on a 95 per cent containment basis.

**Runway visual range (RVR).** The range over which the pilot of an aircraft on the centre line of a runway can see the runway surface markings or the lights delineating the runway or identifying its centre line.

**State of Registry.** The State on whose register the aircraft is entered.

Note.— In the case of the registration of aircraft of an international operating agency on other than a national basis, the States constituting the agency are jointly and severally bound to assume the obligations which, under the Chicago Convention, attach to a State of Registry. See, in this regard, the Council Resolution of 14 December 1967 on Nationality and Registration of Aircraft Operated by International Operating Agencies which can be found in Policy and Guidance Material on the Economic Regulation of International Air Transport (Doc 9587).

**Visual meteorological conditions (VMC).** Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling*, equal to or better than specified minima.

Note.— The specified minima are contained in Chapter 4 of Annex 2.

* As defined in Annex 2.
CHAPTER 2. APPLICABILITY

The Standards and Recommended Practices contained in Annex 6, Part II shall be applicable to international general aviation operations with aeroplanes.

Note 1.— Standards and Recommended Practices applicable to the operation of aeroplanes by operators authorized to conduct international commercial air transport operations are to be found in Annex 6, Part I.

Note 2.— Standards and Recommended Practices applicable to international commercial air transport operations or international general aviation operations with helicopters are to be found in Annex 6, Part III.
CHAPTER 3. GENERAL

Note 1.— Although the Convention on International Civil Aviation allocates to the State of Registry certain functions which that State is entitled to discharge, or obligated to discharge, as the case may be, the Assembly recognized, in Resolution A23-13, that the State of Registry may be unable to fulfill its responsibilities adequately in instances where aircraft are leased, chartered or interchanged — in particular without crew — by an operator of another State and that the Convention may not adequately specify the rights and obligations of the State of an operator in such instances until such time as Article 83 bis of the Convention enters into force. Accordingly, the Council urged that if, in the above-mentioned instances, the State of Registry finds itself unable to discharge adequately the functions allocated to it by the Convention, it delegate to the State of the Operator, subject to acceptance by the latter State, those functions of the State of Registry that can more adequately be discharged by the State of the Operator. It was understood that pending entry into force of Article 83 bis of the Convention the foregoing action would only be a matter of practical convenience and would not affect either the provisions of the Chicago Convention prescribing the duties of the State of Registry or any third State. However, as Article 83 bis of the Convention entered into force on 20 June 1997, such transfer agreements will have effect in respect of Contracting States which have ratified the related Protocol (Doc 9318) upon fulfilment of the conditions established in Article 83 bis.

Note 2.— In the case of international operations effected jointly with aeroplanes not all of which are registered in the same Contracting State, nothing in this Part prevents the States concerned entering into an agreement for the joint exercise of the functions placed upon the State of Registry by the provisions of the relevant Annexes.

3.1 The pilot-in-command shall comply with the relevant laws, regulations and procedures of the States in which the aeroplane is operated.

Note 1.— Compliance with more restrictive measures, not in contravention of the provisions of 3.1, may be required by the State of Registry.

Note 2.— Rules covering flight over the high seas are contained in Annex 2.

3.2 The pilot-in-command shall be responsible for the safety of all crew members, passengers and cargo on board when the doors are closed. The pilot-in-command shall also be responsible for the operation and safety of the aeroplane from the moment the aeroplane is ready to move for the purpose of taking off until the moment it finally comes to rest at the end of the flight and the engine(s) used as primary propulsion units are shut down.

3.3 If an emergency situation which endangers the safety of the aeroplane or persons necessitates the taking of action which involves a violation of local regulations or procedures, the pilot-in-command shall notify the appropriate local authority without delay. If required by the State in which the incident occurs, the pilot-in-command shall submit a report on any such violation to the appropriate authority of such State; in that event, the pilot-in-command shall also submit a copy of it to the State of Registry. Such reports shall be submitted as soon as possible and normally within ten days.

3.4 The pilot-in-command shall be responsible for notifying the nearest appropriate authority by the quickest available means of any accident involving the aeroplane resulting in serious injury or death of any person or substantial damage to the aeroplane or property.

Note.— A definition of the term “serious injury” is contained in Annex 13, and an explanation of the term “substantial damage” is given in the Accident/Incident Reporting Manual (ADREP Manual) (Doc 9156).

3.5 Recommendation.— The pilot-in-command should have available on board the aeroplane essential information concerning the search and rescue services in the areas over which it is intended the aeroplane will be flown.

3.6 Dangerous goods.

Note 1.— Provisions for carriage of dangerous goods are contained in Annex 18.

Note 2.— Article 35 of the Convention refers to certain classes of cargo restrictions.

3.7 Use of psychoactive substances.

Note.— Provisions concerning the use of psychoactive substances are contained in Annex 1, 1.2.7 and Annex 2, 2.5.
CHAPTER 4. FLIGHT PREPARATION AND IN-FLIGHT PROCEDURES

4.1 Adequacy of operating facilities

The pilot-in-command shall not commence a flight unless it has been ascertained by every reasonable means available that the ground and/or water areas and facilities available and directly required for such flight and for the safe operation of the aeroplane are adequate, including communication facilities and navigation aids.

Note.— “Reasonable means” in this Standard is intended to denote the use, at the point of departure, of information available to the pilot-in-command either through official information published by the aeronautical information services or readily obtainable from other sources.

4.2 Aerodrome operating minima

The pilot-in-command shall not operate to or from an aerodrome using operating minima lower than those which may be established for that aerodrome by the State in which it is located, except with the specific approval of that State.

Note.— It is the practice in some States to declare, for flight planning purposes, higher minima for an aerodrome when nominated as an alternate, than for the same aerodrome when planned as that of intended landing.

4.3 Briefing

4.3.1 The pilot-in-command shall ensure that crew members and passengers are made familiar, by means of an oral briefing or by other means, with the location and the use of:

a) seat belts; and, as appropriate,

b) emergency exits;

c) life jackets;

d) oxygen dispensing equipment; and

e) other emergency equipment provided for individual use, including passenger emergency briefing cards.

4.3.2 The pilot-in-command shall ensure that all persons on board are aware of the location and general manner of use of the principal emergency equipment carried for collective use.

4.4 Aeroplane airworthiness and safety precautions

4.4.1 A flight shall not be commenced until the pilot-in-command is satisfied that:

a) the aeroplane is airworthy, duly registered and that appropriate certificates with respect thereto are aboard the aeroplane;

b) the instruments and equipment installed in the aeroplane are appropriate, taking into account the expected flight conditions;

c) any necessary maintenance has been performed in accordance with Chapter 8;

d) the mass of the aeroplane and centre of gravity location are such that the flight can be conducted safely, taking into account the flight conditions expected;

e) any load carried is properly distributed and safely secured; and

f) the aeroplane operating limitations, contained in the flight manual, or its equivalent, will not be exceeded.

4.4.2 Recommendation.— The pilot-in-command should have sufficient information on climb performance with all engines operating to enable determination of the climb gradient that can be achieved during the departure phase for the existing take-off conditions and intended take-off technique.

4.5 Weather reports and forecasts

Before commencing a flight the pilot-in-command shall be familiar with all available meteorological information appropriate to the intended flight. Preparation for a flight away from the vicinity of the place of departure, and for every flight under the instrument flight rules, shall include: 1) a study of available current weather reports and forecasts; and 2) the planning of an alternative course of action to provide for the eventuality that the flight cannot be completed as planned, because of weather conditions.

4.6 Limitations imposed by weather conditions

4.6.1 Flight in accordance with the visual flight rules

A flight, except one of purely local character in visual meteorological conditions, to be conducted in accordance with the visual flight rules shall not be commenced unless available current meteorological reports, or a combination of current reports and forecasts, indicate that the meteorological conditions along the route, or that part of the route to be flown under the visual flight rules, will, at the appropriate time, be such as to render compliance with these rules possible.

4.6.2 Flight in accordance with the instrument flight rules

4.6.2.1 When a destination alternate aerodrome is required. A flight to be conducted in accordance with the instrument flight rules shall not be commenced unless the available information indicates that conditions, at the aerodrome of intended landing and at least one destination alternate will, at the estimated time of arrival, be at or above the aerodrome operating minima.

4.6.2.2 When no destination alternate aerodrome is required. A flight to be conducted in accordance with the instrument flight rules to an aerodrome when no alternate aerodrome is required shall not be commenced unless:

   a) a standard instrument approach procedure is prescribed for the aerodrome of intended landing; and

   b) available current meteorological information indicates that the following meteorological conditions will exist from two hours before to two hours after the estimated time of arrival:

      1) a cloud base of at least 300 m (1 000 ft) above the minimum associated with the instrument approach procedure; and

      2) visibility of at least 5.5 km or of 4 km more than the minimum associated with the procedure.

4.6.3 Aerodrome operating minima

4.6.3.1 A flight shall not be continued towards the aerodrome of intended landing unless the latest available meteorological information indicates that conditions at that aerodrome, or at least one destination alternate aerodrome, will, at the estimated time of arrival, be at or above the specified aerodrome operating minima.

4.6.3.2 An instrument approach shall not be continued beyond the outer marker fix in case of precision approach, or below 300 m (1 000 ft) above the aerodrome in case of non-precision approach, unless the reported visibility or controlling RVR is above the specified minimum.

4.6.3.3 If, after passing the outer marker fix in case of precision approach, or after descending below 300 m (1 000 ft) above the aerodrome in case of non-precision approach, the reported visibility or controlling RVR falls below the specified minimum, the approach may be continued to DA/H or MDA/H. In any case, an aeroplane shall not continue its approach-to-land beyond a point at which the limits of the aerodrome operating minima would be infringed.

Note.— Controlling RVR means the reported values of one or more RVR reporting locations (touchdown, mid-point and stop-end) used to determine whether operating minima are or are not met. Where RVR is used, the controlling RVR is the touchdown RVR, unless otherwise specified by State criteria.

4.6.4 Flight in icing conditions

A flight to be operated in known or expected icing conditions shall not be commenced unless the aeroplane is certificated and equipped to cope with such conditions.

4.7 Destination alternate aerodromes

For a flight to be conducted in accordance with the instrument flight rules, at least one destination alternate aerodrome shall be selected and specified in the flight plan, unless:

   a) the duration of the flight and the meteorological conditions prevailing are such that there is reasonable certainty that, at the estimated time of arrival at the aerodrome of intended landing, and for a reasonable period before and after such time, the approach and landing may be made under visual meteorological conditions; or

   b) the aerodrome of intended landing is isolated and there is no suitable destination alternate aerodrome.

4.8 Fuel and oil supply

4.8.1 A flight shall not be commenced unless, taking into account both the meteorological conditions and any delays that are expected in flight, the aeroplane carries sufficient fuel and oil to ensure that it can safely complete the flight, and, as applicable, the following special provisions are complied with:

4.8.1.1 Flight in accordance with the instrument flight rules. At least sufficient fuel and oil shall be carried to allow the aeroplane:
Annex 6 — Operation of Aircraft

a) when, in accordance with the exception contained in 4.6.2.2, a destination alternate aerodrome is not required, to fly to the aerodrome to which the flight is planned and thereafter for a period of 45 minutes; or

b) when a destination alternate aerodrome is required, to fly to the aerodrome to which the flight is planned, thence to an alternate aerodrome, and thereafter for a period of 45 minutes.

Note.— Nothing in 4.8 precludes amendment of a flight plan in flight in order to re-plan the flight to another aerodrome, provided that the requirements of 4.8 can be complied with from the point where the flight is re-planned.

4.9 Oxygen supply

The pilot-in-command shall ensure that breathing oxygen is available to crew members and passengers in sufficient quantities for all flights at such altitudes where a lack of oxygen might result in impairment of the faculties of crew members or harmfully affect passengers.

Note.— Guidance on the carriage and use of oxygen is given in Attachment B.

4.10 Use of oxygen

All flight crew members, when engaged in performing duties essential to the safe operation of an aeroplane in flight, shall use breathing oxygen continuously whenever the circumstances prevail for which its supply has been required in 4.9.

4.11 In-flight emergency instruction

In an emergency during flight, the pilot-in-command shall ensure that all persons on board are instructed in such emergency action as may be appropriate to the circumstances.

4.12 Weather reporting by pilots

Recommendation.— When weather conditions likely to affect the safety of other aircraft are encountered, they should be reported as soon as possible.

4.13 Hazardous flight conditions

Recommendation.— Hazardous flight conditions, other than those associated with meteorological conditions, encountered en route should be reported as soon as possible. The reports so rendered should give such details as may be pertinent to the safety of other aircraft.

4.14 Fitness of flight crew members

The pilot-in-command shall be responsible for ensuring that a flight:

a) will not be commenced if any flight crew member is incapacitated from performing duties by any cause such as injury, sickness, fatigue, the effects of alcohol or drugs; and

b) will not be continued beyond the nearest suitable aerodrome when flight crew members’ capacity to perform functions is significantly reduced by impairment of faculties from causes such as fatigue, sickness, lack of oxygen.

4.15 Flight crew members at duty stations

4.15.1 Take-off and landing

All flight crew members required to be on flight deck duty shall be at their stations.

4.15.2 En route

All flight crew members required to be on flight deck duty shall remain at their stations except when their absence is necessary for the performance of duties in connection with the operation of the aeroplane, or for physiological needs.

4.15.3 Seat belts

All flight crew members shall keep their seat belts fastened when at their stations.

4.15.4 Safety harness

Recommendation.— When safety harnesses are provided, any flight crew member occupying a pilot’s seat should keep the safety harness fastened during the take-off and landing phases; all other flight crew members should keep their safety harnesses fastened during the take-off and landing phases unless the shoulder straps interfere with the performance of their duties, in which case the shoulder straps may be unfastened but the seat belt must remain fastened.

Note.— Safety harness includes shoulder strap(s) and a seat belt which may be used independently.

4.16 Instrument flight procedures

4.16.1 One or more instrument approach procedures designed in accordance with the classification of instrument
approach and landing operations shall be approved and promulgated by the State in which the aerodrome is located to serve each instrument runway or aerodrome utilized for instrument flight operations.

4.16.2 All aeroplanes operated in accordance with instrument flight rules shall comply with the instrument flight procedures approved by the State in which the aerodrome is located.

Note 1.— Definitions for the classification of instrument approach and landing operations are in Chapter 1.

Note 2.— Operational procedures recommended for the guidance of operations personnel involved in instrument flight operations are described in PANS-OPS (Doc 8168), Volume I.

Note 3.— Criteria for the construction of instrument flight procedures for the guidance of procedure specialists are provided in PANS-OPS (Doc 8168), Volume II.

4.17 Instruction — general

An aeroplane shall not be taxied on the movement area of an aerodrome unless the person at the controls:

a) has been duly authorized by the owner or in the case where it is leased the lessee, or a designated agent;

b) is fully competent to taxi the aeroplane;

c) is qualified to use the radio telephone if radio communications are required; and

d) has received instruction from a competent person in respect of aerodrome layout, and where appropriate, information on routes, signs, marking, lights, ATC signals and instructions, phraseology and procedures, and is able to conform to the operational standards required for safe aeroplane movement at the aerodrome.

4.18 Refuelling with passengers on board

4.18.1 Recommendation.— An aeroplane should not be refuelled when passengers are embarking, on board or disembarking unless it is attended by the pilot-in-command or other qualified personnel ready to initiate and direct an evacuation of the aeroplane by the most practical and expeditious means available.

4.18.2 Recommendation.— When refuelling with passengers embarking, on board or disembarking, two-way communications should be maintained by aeroplane intercommunications system or other suitable means between the ground crew supervising the refuelling and the pilot-in-command or other qualified personnel required by 4.18.1.

Note 1.— The provisions of 4.18.1 do not necessarily require the deployment of integral aeroplane stairs or the opening of emergency exits as a prerequisite to refuelling.

Note 2.— Provisions concerning aircraft refuelling are contained in Annex 14, Volume I and guidance on safe refuelling practices is contained in the Airport Services Manual (Doc 9137), Parts 1 and 8.

Note 3.— Additional precautions are required when refuelling with fuels other than aviation kerosene or when refuelling results in a mixture of aviation kerosene with other aviation turbine fuels, or when an open line is used.
CHAPTER 5. AEROPLANE PERFORMANCE
OPERATING LIMITATIONS

5.1 An aeroplane shall be operated:

a) in compliance with the terms of its airworthiness certificate or equivalent approved document;

b) within the operating limitations prescribed by the certificating authority of the State of Registry; and

c) within the mass limitations imposed by compliance with the applicable noise certification Standards in Annex 16, Volume I, unless otherwise authorized, in exceptional circumstances for a certain aerodrome or a runway where there is no noise disturbance problem, by the competent authority of the State in which the aerodrome is situated.

5.2 Placards, listings, instrument markings, or combinations thereof, containing those operating limitations prescribed by the certificating authority of the State of Registry for visual presentation, shall be displayed in the aeroplane.

Note.— The Standards of Annex 8 — Airworthiness of Aircraft, Parts IIIA and IIIB, apply to all aeroplanes of over 5 700 kg maximum certificated take-off mass intended for the carriage of passengers or cargo or mail in international air navigation.
CHAPTER 6. AEROPLANE INSTRUMENTS AND EQUIPMENT

Note.— Specifications for the provision of aeroplane communication and navigation equipment are contained in Chapter 7.

6.1 All aeroplanes on all flights

6.1.1 General
In addition to the minimum equipment necessary for the issuance of a certificate of airworthiness, the instruments, equipment and flight documents prescribed in the following paragraphs shall be installed or carried, as appropriate, in aeroplanes according to the aeroplane used and to the circumstances under which the flight is to be conducted. The prescribed instruments and equipment, including their installation, shall be approved or accepted by the State of Registry.

6.1.2 Instruments
An aeroplane shall be equipped with instruments which will enable the flight crew to control the flight path of the aeroplane, carry out any required procedural manoeuvre, and observe the operating limitations of the aeroplane in the expected operating conditions.

6.1.3 Equipment
6.1.3.1 All aeroplanes on all flights.
6.1.3.1.1 All aeroplanes on all flights shall be equipped with:
   a) an accessible first-aid kit;
   b) portable fire extinguishers of a type which, when discharged, will not cause dangerous contamination of the air within the aeroplane. At least one shall be located in:
      1) the pilot’s compartment; and
      2) each passenger compartment that is separate from the pilot’s compartment and not readily accessible to the pilot or co-pilot;
   c) 1) a seat or berth for each person over an age to be determined by the State of Registry; and
   2) a seat belt for each seat and restraining belts for each berth;
   d) the following manuals, charts and information:
      1) the flight manual or other documents or information concerning any operating limitations prescribed for the aeroplane by the certificating authority of the State of Registry, required for the application of Chapter 5;
      2) current and suitable charts for the route of the proposed flight and all routes along which it is reasonable to expect that the flight may be diverted;
      3) procedures, as prescribed in Annex 2, for pilots-in-command of intercepted aircraft; and
      4) visual signals for use by intercepting and intercepted aircraft, as contained in Annex 2;
   e) spare electrical fuses of appropriate ratings for replacement of those accessible in flight.

6.1.3.1.2 Recommendation.— All aeroplanes on all flights should be equipped with the ground-air signal codes for search and rescue purposes.

6.1.3.1.3 Recommendation.— All aeroplanes on all flights should be equipped with a safety harness for each flight crew member seat.
Note.— Safety harness includes shoulder strap(s) and a seat belt which may be used independently.

6.1.4 Marking of break-in points
6.1.4.1 If areas of the fuselage suitable for break-in by rescue crews in an emergency are marked on an aeroplane, such areas shall be marked as shown below (see figure following). The colour of the markings shall be red or yellow, and if necessary they shall be outlined in white to contrast with the background.

6.1.4.2 If the corner markings are more than 2 m apart, intermediate lines 9 cm x 3 cm shall be inserted so that there is no more than 2 m between adjacent markings.

Note.— This Standard does not require any aeroplane to have break-in areas.
6.2 All aeroplanes operated as VFR flights

6.2.1 All aeroplanes when operated as VFR flights shall be equipped with:

a) a magnetic compass;
b) an accurate timepiece indicating the time in hours, minutes and seconds;
c) a sensitive pressure altimeter;
d) an airspeed indicator; and
e) such additional instruments or equipment as may be prescribed by the appropriate authority.

6.2.2 Recommendation.— VFR flights which are operated as controlled flights should be equipped in accordance with 6.6.

6.3 All aeroplanes on flights over water

6.3.1 Seaplanes

All seaplanes for all flights shall be equipped with:

a) one life jacket, or equivalent individual floatation device, for each person on board, stowed in a position readily accessible from the seat or berth;
b) equipment for making the sound signals prescribed in the International Regulations for Preventing Collisions at Sea, where applicable;
c) one anchor;
d) one sea anchor (drogue), when necessary to assist in manoeuvring.

Note.— "Seaplanes” includes amphibians operated as seaplanes.

6.3.2 Landplanes

6.3.2.1 Single-engined aeroplanes.

Recommendation.— All single-engined landplanes when flying en route over water beyond gliding distance from the shore should carry one life jacket or equivalent individual floatation device for each person on board, stowed in a position easily accessible from the seat or berth of the person for whose use it is provided.

Note.— "Landplanes” includes amphibians operated as landplanes.

6.3.3 All aeroplanes on extended flights over water

All aeroplanes when operated on extended flights over water shall be equipped with:

MARKING OF BREAK-IN POINTS (see 6.1.4)
a) when the aeroplane may be over water at a distance of more than 93 km (50 NM) away from land suitable for making an emergency landing:

— one life jacket or equivalent individual floatation device for each person on board, stowed in a position easily accessible from the seat or berth of the person for whose use it is provided;

b) when over water away from land suitable for making an emergency landing at a distance of more than 185 km (100 NM), in the case of single-engined aeroplanes, and more than 370 km (200 NM), in the case of multi-engined aeroplanes capable of continuing flight with one engine inoperative:

1) life-saving rafts in sufficient numbers to carry all persons on board, stowed so as to facilitate their ready use in emergency, provided with such life-saving equipment including means of sustaining life as is appropriate to the flight to be undertaken; and

2) equipment for making the pyrotechnical distress signals described in Annex 2.

6.4 All aeroplanes on flights over designated land areas

Aeroplanes when operated across land areas which have been designated by the State concerned as areas in which search and rescue would be especially difficult shall be equipped with such signalling devices and life-saving equipment (including means of sustaining life) as may be appropriate to the area overflown.

6.5 All aeroplanes on high altitude flights

6.5.1 All aeroplanes intended to be operated at high altitudes shall be equipped with oxygen storage and dispensing apparatus capable of storing and dispensing the oxygen supplies required in 4.9.

6.5.2 Aeroplanes for which the individual certificate of airworthiness is first issued on or after 1 January 1990

Pressurized aeroplanes intended to be operated at flight altitudes at which the atmospheric pressure is less than 376 hPa shall be equipped with a device to provide positive warning to the flight crew of any dangerous loss of pressurization.

6.5.3 Aeroplanes for which the individual certificate of airworthiness is first issued before 1 January 1990

Recommendation.— Pressurized aeroplanes intended to be operated at flight altitudes at which the atmospheric pressure is less than 376 hPa should be equipped with a device to provide positive warning to the flight crew of any dangerous loss of pressurization.

6.6 All aeroplanes operated in accordance with the instrument flight rules

All aeroplanes when operated in accordance with the instrument flight rules or when the aeroplane cannot be maintained in a desired attitude without reference to one or more flight instruments, shall be equipped with:

a) a magnetic compass;

b) an accurate timepiece indicating the time in hours, minutes and seconds;

c) a sensitive pressure altimeter;

Note.— Due to the long history of misreadings, the use of drum-pointer altimeters is not recommended.

d) an airspeed indicating system with a means of preventing malfunctioning due to either condensation or icing;

e) a turn and slip indicator;

f) an attitude indicator (artificial horizon);

g) a heading indicator (directional gyroscope);

Note.— The requirements of e), f) and g), may be met by combinations of instruments or by integrated flight director systems provided that the safeguards against total failure, inherent in the three separate instruments, are retained.

h) means of indicating whether the supply of power to the gyroscopic instruments is adequate;

i) a means of indicating in the flight crew compartment the outside air temperature;

j) a rate-of-climb and descent indicator; and

k) such additional instruments or equipment as may be prescribed by the appropriate authority.

6.7 All aeroplanes when operated at night

All aeroplanes, when operated at night, shall be equipped with:
a) all the equipment specified in 6.6;

b) the lights required by Annex 2 for aircraft in flight or operating on the movement area of an aerodrome;

Note.— Specifications for lights meeting the requirements of Annex 2 for navigation lights are contained in the Appendix. The general characteristics of lights are specified in Annex 8. Detailed specifications for lights meeting the requirements of Annex 2 for aircraft in flight or operating on the movement area of an aerodrome are contained in the Airworthiness Manual (Doc 9760).

c) a landing light;

d) illumination for all flight instruments and equipment that are essential for the safe operation of the aeroplane;

e) lights in all passenger compartments; and

f) an electric torch for each crew member station.

6.8 All aeroplanes complying with the noise certification Standards in Annex 16, Volume I

An aeroplane shall carry a document attesting noise certification.

Note.— The attestation may be contained in any document, carried on board, approved by the State of Registry.

6.9 Aeroplanes required to be equipped with ground proximity warning systems (GPWS)

6.9.1 All turbine-engined aeroplanes of a maximum certificated take-off mass in excess of 5 700 kg or authorized to carry more than nine passengers, for which the individual certificate of airworthiness is first issued on or after 1 January 2004, shall be equipped with a ground proximity warning system which has a forward looking terrain avoidance function.

6.9.2 From 1 January 2007, all turbine-engined aeroplanes of a maximum certificated take-off mass in excess of 5 700 kg or authorized to carry more than nine passengers, shall be equipped with a ground proximity warning system which has a forward looking terrain avoidance function.

6.9.3 Recommendation.— All turbine-engined aeroplanes of a maximum certificated take-off mass of 5 700 kg or less and authorized to carry more than five but not more than nine passengers should be equipped with a ground proximity warning system which has a forward looking terrain avoidance function.

6.9.4 Recommendation.— All piston-engined aeroplanes of a maximum certificated take-off mass in excess of 5 700 kg or authorized to carry more than nine passengers should be equipped with a ground proximity warning system which has a forward looking terrain avoidance function.

6.9.5 A ground proximity warning system shall provide automatically a timely and distinctive warning to the flight crew when the aeroplane is in potentially hazardous proximity to the earth’s surface.

6.9.6 A ground proximity warning system shall provide, as a minimum, warnings of at least the following circumstances:

a) excessive descent rate;

b) excessive altitude loss after take-off or go-around; and

6.9.7 Recommendation.— All turbine-engined aeroplanes of a maximum certificated take-off mass in excess of 5 700 kg or authorized to carry more than nine passengers, should be equipped with a ground proximity warning system which has a forward looking terrain avoidance function.

6.10 Flight recorders

Note 1.— Flight recorders comprise two systems, a flight data recorder and a cockpit voice recorder.

Note 2.— Combination recorders (FDR/CVR) can only be used to meet the flight recorder equipage requirements as specifically indicated in this Annex.

Note 3.— Detailed guidance on flight recorders is contained in Attachment A.

6.10.1 Flight data recorders — types

6.10.1.1 A Type I flight data recorder shall record the parameters required to determine accurately the aeroplane flight path, speed, attitude, engine power, configuration and operation.

6.10.1.2 A Type II flight data recorder shall record the parameters required to determine accurately the aeroplane flight path, speed, attitude, engine power and configuration of lift and drag devices.

6.10.1.3 The use of engraving metal foil flight data recorders shall be discontinued by 1 January 1995.

6.10.1.4 Recommendation.— The use of analogue flight data recorders using frequency modulation (FM) should be discontinued by 5 November 1998.
6.10.1.4.1 The use of photographic film flight data recorders shall be discontinued from 1 January 2003.

6.10.1.5 All aeroplanes for which the individual certificate of airworthiness is first issued after 1 January 2005, which utilize data link communications and are required to carry a cockpit voice recorder (CVR), shall record on a flight recorder, all data link communications to and from the aeroplane. The minimum recording duration shall be equal to the duration of the CVR, and shall be correlated to the recorded cockpit audio.

6.10.1.5.1 From 1 January 2007, all aeroplanes which utilize data link communications and are required to carry a CVR, shall record on a flight recorder, all data link communications to and from the aeroplane. The minimum recording duration shall be equal to the duration of the CVR, and shall be correlated to the recorded cockpit audio.

6.10.1.5.2 Sufficient information to derive the content of the data link communications message, and, whenever practical, the time the message was displayed to or generated by the crew shall be recorded.

Note.—Data link communications include, but are not limited to, automatic dependent surveillance (ADS), controller-pilot data link communications (CPDLC), data link-flight information services (D-FIS) and aeronautical operational control (AOC) messages.

6.10.1.6 Recommendation.— All aeroplanes of a maximum certificated take-off mass over 5 700 kg, required to be equipped with a flight data recorder and a cockpit voice recorder, may alternatively be equipped with two combination recorders (FDR/CVR).

6.10.1.7 A Type IA flight data recorder shall record the parameters required to determine accurately the aeroplane flight path, speed, attitude, engine power, configuration and operation. The parameters that satisfy the requirements for a Type IA flight data recorder are listed in the paragraphs below. The parameters without an asterisk (*) are mandatory parameters which shall be recorded. In addition, the parameters designated by an asterisk (*) shall be recorded if an information data source for the parameter is used by aeroplane systems or the flight crew to operate the aeroplane.

6.10.1.7.1 The following parameters satisfy the requirements for flight path and speed:

- Pressure altitude
- Indicated airspeed or calibrated airspeed
- Air – ground status and each landing gear air-ground sensor when practicable
- Total or outside air temperature
- Heading (primary flight crew reference)
- Normal acceleration
- Lateral acceleration
- Longitudinal acceleration (body axis)
- Time or relative time count
- Navigation data*: drift angle, wind speed, wind direction, latitude/longitude
- Groundspeed*
- Radio altitude*

6.10.1.7.2 The following parameters satisfy the requirements for attitude:

- Pitch attitude
- Roll attitude
- Yaw or sideslip angle*
- Angle of attack*

6.10.1.7.3 The following parameters satisfy the requirements for engine power:

- Engine thrust/power: propulsive thrust/power on each engine, cockpit thrust/power lever position
- Thrust reverse status*
- Engine thrust command*
- Engine thrust target*
- Engine bleed valve position*
- Additional engine parameters*: EPR, N1, indicated vibration level, N2, EGT, TLA, fuel flow, fuel cut-off lever position, N3*

6.10.1.7.4 The following parameters satisfy the requirements for configuration:

- Pitch trim surface position
- Flaps*: trailing edge flap position, cockpit control selection
- Slats*: leading edge flap (slat) position, cockpit control selection
- Landing gear*: landing gear, gear selector position
- Yaw trim surface position*
- Roll trim surface position*
- Cockpit trim control input position pitch*
- Cockpit trim control input position roll*
- Cockpit trim control input position yaw*
- Ground spoiler and speed brake*: ground spoiler position, ground spoiler selection, speed brake position, speed brake selection
- De-icing and/or anti-icing systems selection*
- Hydraulic pressure (each system)*
- Fuel quantity*
- AC electrical bus status*
- DC electrical bus status*
- APU bleed valve position*
- Computed centre of gravity*

6.10.1.7.5 The following parameters satisfy the requirements for operation:

- Warnings
- Primary flight control surface and primary flight control pilot input: pitch axis, roll axis, yaw axis
- Marker beacon passage
Annex 6 — Operation of Aircraft Part II

Note 1.— Parameter requirements, including range, sampling, accuracy and resolution, as contained in the Minimum Operational Performance Specification (MOPS) document for Flight Recorder Systems of the European Organization for Civil Aviation Equipment (EUROCAE) or equivalent documents.

Note 2.— The number of parameters to be recorded will depend on aeroplane complexity. Parameters without an (*) are to be recorded regardless of aeroplane complexity. Those parameters designated by an (*) are to be recorded if an information source for the parameter is used by aeroplane systems and/or flight crew to operate the aeroplane.

6.10.2 Flight data recorders — duration

Types I and II flight data recorders shall be capable of retaining the information recorded during at least the last 25 hours of their operation.

6.10.3 Flight data recorders — aeroplanes for which the individual certificate of airworthiness is first issued on or after 1 January 1989

6.10.3.1 All aeroplanes of a maximum certificated take-off mass of over 27 000 kg shall be equipped with a Type I flight data recorder.

6.10.3.2 Recommendation.— All aeroplanes of a maximum certificated take-off mass of over 5 700 kg up to and including 27 000 kg should be equipped with a Type II flight data recorder.

6.10.4 Flight data recorders — aeroplanes for which the individual certificate of airworthiness is first issued after 1 January 2005

6.10.5 Cockpit voice recorders — aeroplanes for which the individual certificate of airworthiness is first issued on or after 1 January 1987

All aeroplanes of a maximum certificated take-off mass of over 5 700 kg shall be equipped with a Type IA flight data recorder.

6.10.5.1 All aeroplanes of a maximum certificated take-off mass of over 27 000 kg shall be equipped with a cockpit voice recorder, the objective of which is the recording of the aural environment on the flight deck during flight time.

6.10.5.2 Recommendation.— All aeroplanes of a maximum certificated take-off mass of over 5 700 kg up to and including 27 000 kg should be equipped with a cockpit voice recorder, the objective of which is the recording of the aural environment on the flight deck during flight time.
6.10.6 Cockpit voice recorders — duration

6.10.6.1 A cockpit voice recorder shall be capable of retaining the information recorded during at least the last 30 minutes of its operation.

6.10.6.2 Recommendation. — A cockpit voice recorder, installed in aeroplanes of a maximum certificated take-off mass of over 5 700 kg for which the individual certificate of airworthiness is first issued on or after 1 January 1990, should be capable of retaining the information recorded during at least the last two hours of its operation.

6.10.6.3 A cockpit voice recorder, installed in aeroplanes of a maximum certificated take-off mass of over 5 700 kg for which the individual certificate of airworthiness is first issued after 1 January 2003, shall be capable of retaining the information recorded during at least the last two hours of its operation.

6.10.7 Flight recorders — construction and installation

Flight recorders shall be constructed, located and installed so as to provide maximum practical protection for the recordings in order that the recorded information may be preserved, recovered and transcribed. Flight recorders shall meet the prescribed crashworthiness and fire protection specifications.

Note.— Industry crashworthiness and fire protection specifications can be found in documents such as the European Organization for Civil Aviation Equipment (EUROCAE) documents ED55 and ED56A.

6.10.8 Flight recorders — operation

6.10.8.1 Flight recorders shall not be switched off during flight time.

6.10.8.2 To preserve flight recorder records, flight recorders shall be de-activated upon completion of flight time following an accident or incident. The flight recorders shall not be re-activated before their disposition as determined in accordance with Annex 13.

Note 1.— The need for removal of the flight recorder records from the aircraft will be determined by the investigation authority in the State conducting the investigation with due regard to the seriousness of an occurrence and the circumstances, including the impact on the operation.

Note 2.— The pilot-in-command’s responsibilities regarding the retention of flight recorder records are contained in 6.10.9.

6.10.9 Flight recorder records

The pilot-in-command shall ensure, to the extent possible, in the event the aeroplane becomes involved in an accident or incident, the preservation of all related flight recorder records, and if necessary the associated flight recorders, and their retention in safe custody pending their disposition as determined in accordance with Annex 13.

6.10.10 Flight recorders — continued serviceability

Operational checks and evaluations of recordings from the flight data and cockpit voice recorder systems shall be conducted to ensure the continued serviceability of the recorders.

Note.— Procedures for the inspections of the flight data and cockpit voice recorder systems are given in Attachment A.

6.11 Mach number indicator

All aeroplanes with speed limitations expressed in terms of Mach number shall be equipped with a Mach number indicator.

Note.— This does not preclude the use of the airspeed indicator to derive Mach number for ATS purposes.

6.12 Emergency locator transmitter (ELT)

6.12.1 Except as provided for in 6.12.2, until 1 January 2005 all aeroplanes operated on extended flights over water as described in 6.3.3 b) and when operated on flights over designated land areas as described in 6.4 shall be equipped with one ELT.

6.12.2 All aeroplanes for which the individual certificate of airworthiness is first issued after 1 January 2002, operated on extended flights over water as described in 6.3.3 b) and when operated on flights over designated land areas as described in 6.4 shall be equipped with one automatic ELT.

6.12.3 From 1 January 2005, all aeroplanes operated on extended flights over water as described in 6.3.3 b) and when operated on flights over designated land areas as described in 6.4 shall be equipped with one automatic ELT.

6.12.4 Recommendation. — All aeroplanes should carry an automatic ELT.

6.12.5 ELT equipment carried to satisfy the requirements of 6.12.1, 6.12.2, 6.12.3 and 6.12.4 shall operate in accordance with the relevant provisions of Annex 10, Volume III.
6.13 Aeroplanes required to be equipped with a pressure-altitude reporting transponder

6.13.1 From 1 January 2003, unless exempted by the appropriate authorities, all aeroplanes shall be equipped with a pressure-altitude reporting transponder which operates in accordance with the relevant provisions of Annex 10, Volume IV.

6.13.2 Recommendation.— All aeroplanes should be equipped with a pressure-altitude reporting transponder which operates in accordance with the relevant provisions of Annex 10, Volume IV.

Note.— The provisions in 6.13.1 and 6.13.2 are intended to support the effectiveness of ACAS as well as to improve the effectiveness of air traffic services. Effective dates for carriage requirements of ACAS are contained in Annex 6, Part I, 6.18.1 and 6.18.2. The intent is also for aircraft not equipped with pressure-altitude reporting transponders to be operated so as not to share airspace used by aircraft equipped with airborne collision avoidance systems. To this end, exemptions from the carriage requirement for pressure-altitude reporting transponders could be given by designating airspace where such carriage is not required.

6.14 Microphones

Recommendation.— All flight crew members required to be on flight deck duty should communicate through boom or throat microphones below the transition level/altitude.
CHAPTER 7. AEROPLANE COMMUNICATION AND NAVIGATION EQUIPMENT

7.1 Communication equipment

7.1.1 An aeroplane to be operated in accordance with the instrument flight rules or at night shall be provided with radio communication equipment. Such equipment shall be capable of conducting two-way communication with those aeronautical stations and on those frequencies prescribed by the appropriate authority.

Note.— The requirements of 7.1.1 are considered fulfilled if the ability to conduct the communications specified therein is established during radio propagation conditions which are normal for the route.

7.1.2 When compliance with 7.1.1 requires that more than one communication equipment unit be provided, each shall be independent of the other or others to the extent that a failure in any one will not result in failure of any other.

7.1.3 An aeroplane to be operated in accordance with the visual flight rules, but as a controlled flight, shall, unless exempted by the appropriate authority, be provided with radio communication equipment capable of conducting two-way communication at any time during flight with such aeronautical stations and on such frequencies as may be prescribed by the appropriate authority.

7.1.4 An aeroplane to be operated on a flight to which the provisions of 6.3.3 or 6.4 apply shall, unless exempted by the appropriate authority, be provided with radio communication equipment capable of conducting two-way communication at any time during flight with such aeronautical stations and on such frequencies as may be prescribed by the appropriate authority.

7.1.5 The radio communication equipment required in accordance with 7.1.1 to 7.1.4 shall provide for communication on the aeronautical emergency frequency 121.5 MHz.

7.2 Navigation equipment

7.2.1 An aeroplane shall be provided with navigation equipment which will enable it to proceed:

a) in accordance with the flight plan; and
b) in accordance with the requirements of air traffic services;

except when, if not so precluded by the appropriate authority, navigation for flights under the visual flight rules is accomplished by visual reference to landmarks at least every 110 km (60 NM).

7.2.2 For flights in defined portions of airspace or on routes where an RNP type has been prescribed, an aeroplane shall, in addition to the requirements specified in 7.2.1:

a) be provided with navigation equipment which will enable it to operate in accordance with the prescribed RNP type(s); and
b) be authorized by the State of Registry for operations in such airspace.

Note.— Information on RNP and associated procedures, and guidance concerning the approval process, are contained in the Manual on Required Navigation Performance (RNP) (Doc 9613). This document also contains a comprehensive list of references to other documents produced by States and international bodies concerning navigation systems and RNP.

7.2.3 For flights in defined portions of airspace where, based on Regional Air Navigation Agreement, minimum navigation performance specifications (MNPS) are prescribed, an aeroplane shall be provided with navigation equipment which:

a) continuously provides indications to the flight crew of adherence to or departure from track to the required degree of accuracy at any point along that track; and
b) has been authorized by the State of Registry for MNPS operations concerned.

Note.— The prescribed minimum navigation performance specifications and the procedures governing their application are published in Regional Supplementary Procedures (Doc 7030).

7.2.4 For flights in defined portions of airspace where, based on Regional Air Navigation Agreement, a vertical separation minimum (VSM) of 300 m (1 000 ft) is applied above FL 290, an aeroplane:

a) shall be provided with equipment which is capable of:

1) indicating to the flight crew the flight level being flown;
2) automatically maintaining a selected flight level;

3) providing an alert to the flight crew when a deviation occurs from the selected flight level. The threshold for the alert shall not exceed ± 90 m (300 ft); and

4) automatically reporting pressure-altitude; and

b) shall be authorized by the State of Registry for operation in the airspace concerned.

7.2.5 The aeroplane shall be sufficiently provided with navigation equipment to ensure that, in the event of the failure of one item of equipment at any stage of the flight, the remaining equipment will enable the aeroplane to navigate in accordance with 7.2.1 and where applicable 7.2.2, 7.2.3 and 7.2.4.

Note 1.— This requirement may be met by means other than the duplication of equipment.

Note 2.— Guidance material relating to aircraft equipment necessary for flight in airspace where a 300 m (1 000 ft) VSM is applied above FL 290 is contained in the Manual on Implementation of a 300 m (1 000 ft) Vertical Separation Minimum Between FL 290 and FL 410 Inclusive (Doc 9574).

7.2.6 On flights in which it is intended to land in instrument meteorological conditions, an aeroplane shall be provided with radio equipment capable of receiving signals providing guidance to a point from which a visual landing can be effected. This equipment shall be capable of providing such guidance for each aerodrome at which it is intended to land in instrument meteorological conditions and for any designated alternate aerodromes.
CHAPTER 8. AEROPLANE MAINTENANCE

Note 1.—For the purpose of this chapter “aeroplane” includes: powerplants, propellers, components, accessories, instruments, equipment and apparatus including emergency equipment.

Note 2.—Guidance on continuing airworthiness requirements is contained in the Airworthiness Manual (Doc 9760).

8.1 Responsibilities

8.1.1 The owner of an aeroplane, or in the case where it is leased, the lessee, shall ensure that:

a) the aeroplane is maintained in an airworthy condition;

b) the operational and emergency equipment necessary for the intended flight is serviceable;

c) the Certificate of Airworthiness of the aeroplane remains valid; and

d) the maintenance of the aeroplane is performed in accordance with a maintenance programme acceptable to the State of Registry.

8.1.2 The aeroplane shall not be operated unless it is maintained and released to service under a system acceptable to the State of Registry.

8.1.3 When the maintenance release is not issued by an approved maintenance organization in accordance with Annex 6, Part I, 8.7, the person signing the maintenance release shall be licensed in accordance with Annex 1.

8.2 Maintenance records

8.2.1 The owner shall ensure that the following records are kept for the periods mentioned in 8.2.2:

a) the total time in service (hours, calendar time and cycles, as appropriate) of the aeroplane and all life limited components;

b) the current status of compliance with all mandatory continuing airworthiness information;

c) appropriate details of modifications and repairs;

d) the time in service (hours, calendar time and cycles, as appropriate) since last overhaul of the aeroplane or its components subject to a mandatory overhaul life;

e) the current status of the aeroplane’s compliance with the maintenance programme; and

f) the detailed maintenance records to show that all requirements for signing a maintenance release have been met.

8.2.2 The records referred to in 8.2.1 a) to e) shall be kept for a minimum period of 90 days after the unit to which they refer has been permanently withdrawn from service, and the records in 8.2.1 f) for a minimum period of one year after the signing of the maintenance release.

8.2.3 The lessee of an aeroplane shall comply with the requirements of 8.2.1 and 8.2.2, as applicable, while the aeroplane is leased.

Note.—Maintenance records or related documents, other than a valid certificate of airworthiness, need not be carried in the aeroplane during international flights.

8.3 Continuing airworthiness information

The owner of an aeroplane over 5 700 kg maximum certificated take-off mass, or in the case where it is leased, the lessee, shall, as prescribed by the State of Registry, ensure that the information resulting from maintenance and operational experience with respect to continuing airworthiness, is transmitted as required by Annex 8, Part II, 4.3.5 and 4.3.8.

8.4 Modifications and repairs

All modifications and repairs shall comply with airworthiness requirements acceptable to the State of Registry. Procedures shall be established to ensure that the substantiating data supporting compliance with the airworthiness requirements are retained.
8.5 Maintenance release

8.5.1 A maintenance release shall be completed and signed, as prescribed by the State of Registry, to certify that the maintenance work performed has been completed satisfactorily.

8.5.2 A maintenance release shall contain a certification including:

a) basic details of the maintenance carried out;

b) date such maintenance was completed;

c) when applicable, the identity of the approved maintenance organization; and

d) the identity of the person or persons signing the release.
CHAPTER 9. AEROPLANE FLIGHT CREW

9.1 Qualifications

The pilot-in-command shall ensure that the licences of each flight crew member have been issued or rendered valid by the State of Registry, and are properly rated and of current validity, and shall be satisfied that flight crew members have maintained competence.

9.2 Composition of the flight crew

The number and composition of the flight crew shall not be less than that specified in the flight manual or other documents associated with the certificate of airworthiness.
APPENDIX. LIGHTS TO BE DISPLAYED BY AEROPLANES

(Note.— See Chapter 6)

1. Terminology

When the following terms are used in this Appendix, they have the following meanings:

**Angles of coverage.**

a) Angle of coverage A is formed by two intersecting vertical planes making angles of 70 degrees to the right and 70 degrees to the left respectively, looking aft along the longitudinal axis to a vertical plane passing through the longitudinal axis.

b) Angle of coverage F is formed by two intersecting vertical planes making angles of 110 degrees to the right and 110 degrees to the left respectively, looking forward along the longitudinal axis to a vertical plane passing through the longitudinal axis.

c) Angle of coverage L is formed by two intersecting vertical planes, one parallel to the longitudinal axis of the aeroplane, and the other 110 degrees to the left of the first, when looking forward along the longitudinal axis.

d) Angle of coverage R is formed by two intersecting vertical planes, one parallel to the longitudinal axis of the aeroplane, and the other 110 degrees to the right of the first, when looking forward along the longitudinal axis.

**Horizontal plane.** The plane containing the longitudinal axis and perpendicular to the plane of symmetry of the aeroplane.

**Longitudinal axis of the aeroplane.** A selected axis parallel to the direction of flight at a normal cruising speed, and passing through the centre of gravity of the aeroplane.

**Making way.** An aeroplane on the surface of the water is ‘making way’ when it is under way and has a velocity relative to the water.

**Under command.** An aeroplane on the surface of the water is ‘under command’ when it is able to execute manoeuvres as required by the International Regulations for Preventing Collisions at Sea for the purpose of avoiding other vessels.

**Under way.** An aeroplane on the surface of the water is ‘under way’ when it is not aground or moored to the ground or to any fixed object on the land or in the water.

**Vertical planes.** Planes perpendicular to the horizontal plane.

**Visible.** Visible on a dark night with a clear atmosphere.

2. Navigation lights to be displayed in the air

Note.— The lights specified herein are intended to meet the requirements of Annex 2 for navigation lights.

As illustrated in Figure 1, the following unobstructed navigation lights shall be displayed:

- a) a red light projected above and below the horizontal plane through angle of coverage L;
- b) a green light projected above and below the horizontal plane through angle of coverage R;
- c) a white light projected above and below the horizontal plane rearward through angle of coverage A.

3. Lights to be displayed on the water

3.1 General

Note.— The lights specified herein are intended to meet the requirements of Annex 2 for lights to be displayed by aeroplanes on the water.

The International Regulations for Preventing Collisions at Sea require different lights to be displayed in each of the following circumstances:

- a) when under way;
b) when towing another vessel or aeroplane;
c) when being towed;
d) when not under command and not making way;
e) when making way but not under command;
f) when at anchor;
g) when aground.

The lights required by aeroplanes in each case are described below.

3.2 When under way

As illustrated in Figure 2, the following appearing as steady unobstructed lights:

a) a red light projected above and below the horizontal through angle of coverage \( L \);
b) a green light projected above and below the horizontal through angle of coverage \( R \);
c) a white light projected above and below the horizontal through angle of coverage \( A \); and
d) a white light projected through angle of coverage \( F \).

The lights described in a), b) and c) should be visible at a distance of at least 3.7 km (2 NM). The light described in d) should be visible at a distance of 9.3 km (5 NM) when fitted to an aeroplane of 20 m or more in length or visible at a distance of 5.6 km (3 NM) when fitted to an aeroplane of less than 20 m in length.

3.3 When towing another vessel or aeroplane

As illustrated in Figure 3, the following appearing as steady, unobstructed lights:

a) the lights described in 3.2 above;
b) a second light having the same characteristics as the light described in 3.2 d) and mounted in a vertical line at least 2 m above or below it; and
c) a yellow light having otherwise the same characteristics as the light described in 3.2 c) and mounted in a vertical line at least 2 m above it.

3.4 When being towed

The lights described in 3.2 a), b) and c) appearing as steady, unobstructed lights.

3.5 When not under command and not making way

As illustrated in Figure 4, two steady red lights placed where they can best be seen, one vertically over the other and not less than 1 m apart, and of such a character as to be visible all around the horizon at a distance of at least 3.7 km (2 NM).

3.6 When making way but not under command

As illustrated in Figure 5, the lights described in 3.5 plus the lights described in 3.2 a), b) and c).

Note.— The display of lights prescribed in 3.5 and 3.6 above is to be taken by other aircraft as signals that the aeroplane showing them is not under command and cannot therefore get out of the way. They are not signals of aeroplanes in distress and requiring assistance.
3.7 When at anchor

a) If less than 50 m in length, where it can best be seen, a steady white light (Figure 6), visible all around the horizon at a distance of at least 3.7 km (2 NM).

b) If 50 m or more in length, where they can best be seen, a steady white forward light and a steady white rear light (Figure 7) both visible all around the horizon at a distance of at least 5.6 km (3 NM).

c) If 50 m or more in span a steady white light on each side (Figures 8 and 9) to indicate the maximum span and visible, so far as practicable, all around the horizon at a distance of at least 1.9 km (1 NM).

3.8 When aground

The lights prescribed in 3.7 and in addition two steady red lights in vertical line, at least 1 m apart so placed as to be visible all around the horizon.
ATTACHMENT A. FLIGHT RECORDERS

Supplementary to 6.10

Introduction

The material in this Attachment concerns flight recorders intended for installation in aeroplanes engaged in international air navigation. Flight recorders comprise two systems — a flight data recorder and a cockpit voice recorder. Flight data recorders are classified as Type I and Type II depending upon the number of parameters to be recorded.

1. Flight data recorder (FDR)

1.1 General requirements

1.1.1 The recorder is to record continuously during flight time.

1.1.2 The recorder container is to:

a) be painted a distinctive orange or yellow colour;

b) carry reflective material to facilitate its location; and

c) have securely attached an automatically activated underwater locating device.

1.1.3 The recorder is to be installed so that:

a) the probability of damage to the recording is minimized. To meet this requirement it should be located as far aft as practicable. In the case of pressurized aeroplanes it should be located in the vicinity of the rear pressure bulkhead;

b) it receives its electrical power from a bus that provides the maximum reliability for operation of the recorder without jeopardizing service to essential or emergency loads; and

C) there is an aural or visual means for pre-flight checking that the recorder is operating properly.

1.2 Parameters to be recorded

1.2.1 Type I flight data recorder. This recorder will be capable of recording, as appropriate to the aeroplane, at least the 32 parameters in Table A-1. However, other parameters may be substituted with due regard to the aeroplane type and the characteristics of the recording equipment.

1.2.2 Type II flight data recorder. This recorder will be capable of recording, as appropriate to the aeroplane, at least the first 15 parameters in Table A-1. However, other parameters may be substituted with due regard to the aeroplane type and the characteristics of the recording equipment.

1.3 Additional information

1.3.1 The measurement range, recording interval and accuracy of parameters on installed equipment is usually verified by methods approved by the appropriate certificating authority.

1.3.2 The manufacturer usually provides the national certificating authority with the following information in respect of the flight data recorder:

a) manufacturer’s operating instructions, equipment limitations and installation procedures;

b) parameter origin or source and equations which relate counts to units of measurement; and

c) manufacturer’s test reports.

1.3.3 Documentation concerning parameter allocation, conversion equations, periodic calibration and other serviceability/maintenance information should be maintained by the operator. The documentation must be sufficient to ensure that accident investigation authorities have the necessary information to read out the data in engineering units.

2. Cockpit voice recorder (CVR)

2.1 General requirements

2.1.1 The recorder is to be designed so that it will record at least the following:

a) voice communication transmitted from or received in the aeroplane by radio;

b) aural environment on the flight deck;

c) voice communication of flight crew members on the flight deck using the aeroplane’s interphone system;
d) voice or audio signals identifying navigation or approach aids introduced in the headset or speaker;

e) voice communication of flight crew members using the passenger address system, if installed; and

f) digital communications with ATS, unless recorded by the flight data recorder.

2.1.2 The recorder container is to:

a) be painted a distinctive orange or yellow colour;

b) carry reflective material to facilitate its location; and

c) have securely attached an automatically activated underwater locating device.

2.1.3 To aid in voice and sound discrimination, microphones in the cockpit are to be located in the best position for recording voice communications originating at the pilot and co-pilot stations and voice communications of other crew members on the flight deck when directed to those stations. This can best be achieved by wiring suitable boom microphones to record continuously on separate channels.

2.1.4 The recorder is to be installed so that:

a) the probability of damage to the recording is minimized. To meet this requirement it should be located as far aft as practicable. In the case of pressurized aeroplanes it should be located in the vicinity of the rear pressure bulkhead;

b) it receives its electrical power from a bus that provides the maximum reliability for operation of the recorder without jeopardizing service to essential or emergency loads;

c) there is an aural or visual means for pre-flight checking of the recorder for proper operation; and

d) if the recorder has a bulk erasure device, the installation should be designed to prevent operation of the device during flight time or crash impact.

2.2 Performance requirements

2.2.1 The recorder will be capable of recording on at least four tracks simultaneously. To ensure accurate time correlation between tracks, the recorder is to record in an in-line format. If a bi-directional configuration is used, the in-line format and track allocation should be retained in both directions.

2.2.2 The preferred track allocation is as follows:

Track 1 — co-pilot headphones and live boom microphone

Track 2 — pilot headphones and live boom microphone

Track 3 — area microphone

Track 4 — time reference plus the third and fourth crew member’s headphone and live microphone, if applicable.

Note 1.— Track 1 is located closest to the base of the recording head.

Note 2.— The preferred track allocation presumes use of current conventional magnetic tape transport mechanisms, and is specified because the outer edges of the tape have a higher risk of damage than the middle. It is not intended to preclude use of alternative recording media where such constraints may not apply.

2.2.3 The recorder, when tested by methods approved by the appropriate certificating authority, will be demonstrated to be suitable for the environmental extremes over which it is designed to operate.

2.2.4 Means will be provided for an accurate time correlation between the flight data recorder and the cockpit voice recorder.

Note.— One method of achieving this is by superimposing the FDR time signal on the CVR.

2.3 Additional information

2.3.1 The manufacturer usually provides the national certificating authority with the following information in respect of the cockpit voice recorder:

a) manufacturer’s operating instructions, equipment limitations and installation procedures; and

b) manufacturer’s test reports.

3. Inspections of flight data and cockpit voice recorder systems

3.1 Prior to the first flight of the day, the built-in test features on the flight deck for the CVR, FDR and Flight Data Acquisition Unit (FDAU), when installed, should be monitored.

3.2 Annual inspections should be carried out as follows:

a) the readout of the recorded data from the FDR and CVR should ensure that the recorder operates correctly for the nominal duration of the recording;
b) the analysis of the FDR should evaluate the quality of the recorded data to determine if the bit error rate is within acceptable limits and to determine the nature and distribution of the errors;

c) a complete flight from the FDR should be examined in engineering units to evaluate the validity of all recorded parameters. Particular attention should be given to parameters from sensors dedicated to the FDR. Parameters taken from the aircraft’s electrical bus system need not be checked if their serviceability can be detected by other aircraft systems;

d) the readout facility should have the necessary software to accurately convert the recorded values to engineering units and to determine the status of discrete signals;

e) an annual examination of the recorded signal on the CVR should be carried out by replay of the CVR recording. While installed in the aircraft the CVR should record test signals from each aircraft source and from relevant external sources to ensure that all required signals meet intelligibility standards; and

f) where practicable, during the annual examination, a sample of in-flight recordings of the CVR should be examined for evidence that the intelligibility of the signal is acceptable.

3.3 Flight recorder systems should be considered unserviceable if there is a significant period of poor quality data, unintelligible signals, or if one or more of the mandatory parameters is not recorded correctly.

3.4 A report of the annual inspection should be made available on request to the State’s regulatory authority for monitoring purposes.

3.5 Calibration of the FDR system:

a) the FDR system should be re-calibrated at least every five years to determine any discrepancies in the engineering conversion routines for the mandatory parameters, and to ensure that parameters are being recorded within the calibration tolerances; and

b) when the parameters of altitude and airspeed are provided by sensors that are dedicated to the FDR system, there should be a re-calibration performed as recommended by the sensor manufacturer, or at least every two years.

</tbody>
</table>

**Note.—** The preceding 15 parameters satisfy the requirements for a Type II FDR.
### Operation of Aircraft

#### Notes.
1. \( V_{S0} \) stalling speed or minimum steady flight speed in the landing configuration.
2. \( V_D \) design diving speed.
3. Record sufficient inputs to determine power.
4. For aeroplanes with conventional control systems “or” applies. For aeroplanes with non-mechanical control systems “and” applies. In aeroplanes with split surfaces, a suitable combination of inputs is acceptable in lieu of recording each surface separately.
5. If signal available in digital form.
6. Recording of latitude and longitude from INS or other navigation system is a preferred alternative.
7. If signals readily available.

*Note.— The preceding 32 parameters satisfy the requirements for a Type I FDR.*
If further recording capacity is available, recording of the following additional information should be considered:

a) operational information from electronic display systems, such as electronic flight instrument systems (EFIS), electronic centralized aircraft monitor (ECAM) and engine indication and crew alerting system (EICAS). Use the following order of priority:

1) parameters selected by the flight crew relating to the desired flight path, e.g. barometric pressure setting, selected altitude, selected airspeed, decision height, and autoflight system engagement and mode indications if not recorded from another source;

2) display system selection/status, e.g. SECTOR, PLAN, ROSE, NAV, WXR, COMPOSITE, COPY, ETC.;

3) warnings and alerts;

4) the identity of displayed pages for emergency procedures and checklists;

b) retardation information including brake application for use in the investigation of landing overruns and rejected take-offs; and

c) additional engine parameters (EPR, N1, EGT, fuel flow, etc.).
ATTACHMENT B. CARRIAGE AND USE OF OXYGEN

Supplementary to 4.9

Introduction

The performance of crew members and the well-being of passengers during flights at such altitudes where a lack of oxygen might result in impairment of faculties are of major concern. Research conducted in altitude chambers or by exposure to mountain elevations indicates that human tolerance could be related to the altitude concerned and the exposure time. The subject is dealt with in detail in the Manual of Civil Aviation Medicine (Doc 8984). In the light of the above and to further assist the pilot-in-command in providing the oxygen supply intended by 4.9 of this Annex, the following guidelines, which take into account the requirements already established in Annex 6, Part I, are considered relevant.

1. Oxygen supply

1.1 A flight to be operated at altitudes at which the atmospheric pressure in personnel compartments will be less than 700 hPa should not be commenced unless sufficient stored breathing oxygen is carried to supply:

a) all crew members and at least 10 per cent of the passengers for any period in excess of 30 minutes that the pressure in compartments occupied by them will be between 700 hPa and 620 hPa; and

b) all crew members and passengers for any period that the atmospheric pressure in compartments occupied by them will be less than 620 hPa.

1.2 A flight to be operated with a pressurized aeroplane should not be commenced unless a sufficient quantity of stored breathing oxygen is carried to supply all crew members and passengers, as is appropriate to the circumstances of the flight being undertaken, in the event of loss of pressurization, for any period that the atmospheric pressure in any compartment occupied by them would be less than 700 hPa. In addition, when an aeroplane is operated at flight altitudes at which the atmospheric pressure is less than 376 hPa, or which, if operated at flight altitudes at which the atmospheric pressure is more than 376 hPa and cannot descend safely within four minutes to a flight altitude at which the atmospheric pressure is equal to 620 hPa, there shall be no less than a 10-minute supply for the occupants of the passenger compartment.

2. Use of oxygen

2.1 All flight crew members, when engaged in performing duties essential to the safe operation of an aeroplane in flight, should use breathing oxygen continuously whenever the circumstances prevail for which its supply has been indicated to be necessary in 1.1 or 1.2.

2.2 All flight crew members of pressurized aeroplanes operating above an altitude where the atmospheric pressure is less than 376 hPa should have available at the flight duty station a quick donning type of mask which will readily supply oxygen upon demand.

Note.— Approximate altitudes in the Standard Atmosphere corresponding to the values of absolute pressure used in the text are as follows:

<table>
<thead>
<tr>
<th>Absolute pressure</th>
<th>Metres</th>
<th>Feet</th>
</tr>
</thead>
<tbody>
<tr>
<td>700 hPa</td>
<td>3 000</td>
<td>10 000</td>
</tr>
<tr>
<td>620 hPa</td>
<td>4 000</td>
<td>13 000</td>
</tr>
<tr>
<td>376 hPa</td>
<td>7 600</td>
<td>25 000</td>
</tr>
</tbody>
</table>

— END —
SUPPLEMENT TO

ANNEX 6 — OPERATION OF AIRCRAFT

PART II — INTERNATIONAL GENERAL AVIATION — AEROPLANES

(Sixth Edition)

1. The attached Supplement supersedes all previous Supplements to Annex 6, Part II, and includes differences notified by Contracting States up to 30 September 2002 with respect to all amendments up to and including Amendment 21.

2. This Supplement should be inserted at the end of Annex 6, Part II (Sixth Edition). Additional differences received from Contracting States will be issued at intervals as amendments to this Supplement.
Differences between the national regulations and practices of Contracting States and the corresponding International Standards and Recommended Practices contained in Annex 6, Part II, as notified to ICAO in accordance with Article 38 of the *Convention on International Civil Aviation* and the Council’s resolution of 21 November 1950.

CHAPTER 1

Definitions

*Aerodrome operating minima.* The former definition has been retained for subparagraph c).

*Approach and landing operations using instrument approach procedures.* The former definition has been retained.

*Decision altitude (DA) or decision height (DH).* The former definition has been retained.

*Flight time — aeroplanes.* The former definition has been retained.

CHAPTER 6

6.10.1.7 The Argentine Republic does not require the installation of a Type 1A recorder.

6.10.1.7.1 The Argentine Republic only requires recording of the following parameters: pressure altitude; speed; heading; normal acceleration; longitudinal acceleration; and time.

6.10.1.7.2 The Argentine Republic only requires recording of the following parameters: pitch attitude and roll attitude.

6.10.1.7.3 The Argentine Republic only requires recording of thrust.

6.10.1.7.4 The Argentine Republic only requires recording of the pitch trim surface position.

6.10.1.7.5 The Argentine Republic does not apply this requirement.

6.10.4 The Argentine Republic requires cockpit voice recorders to record only 11 parameters.

CHAPTER 8

8.1.3 In the Argentine Republic, only an approved maintenance organization may issue a maintenance release.

8.2.2 Maintenance records that attest to the completion of maintenance must be kept for five years after the signing of the maintenance release.
CHAPTER 1

Definitions

Approach and landing operations using instrument approach procedures. Australian legislation does not define approach and landing operations with vertical guidance. Australia does not yet have any instrument approach procedures that utilize GPSD data for vertical guidance.

CHAPTER 4

4.6.1

Australia places the decision-making responsibility on the pilot-in-command for commencement and continuation of a flight.

4.18.2*

There is no requirement to maintain two-way communications between the aeroplane and the ground crew while refuelling with passengers on board.

CHAPTER 6

6.1.3.1.1

The requirements for carriage of first-aid kits and fire extinguishers are not implemented as prescribed.

6.2.2*

Australian legislation does not base the requirement to be equipped in accordance with 6.6 on whether the flight is a controlled flight or not.

6.3.1 b)

The sound signal requirement is not implemented.

6.8

There is no requirement for the carriage of a noise certificate in an aeroplane.

6.9.2*

Australia does not require fitment of GPWS to any piston-engined aeroplanes, whether above or below 5 700 kg MCTOM.

6.9.5*

Australia will apply this requirement to all turbine-powered aeroplanes greater than 15 000 kg MCTOM or carrying 10 or more passengers in passenger transport operations under the IFR from 1 July 2005.

6.10.1.1

Australian legislation does not refer to FDRs by Type, but specifies the parameters to be recorded.

6.10.1.2

6.10.1.3

Metal foil FDRs are still permitted.

6.10.1.4*

Current legislation specifies that analogue recorders will not be approved for fitment to aircraft which receive their initial use Certificate of Airworthiness after 1 January 1984.

6.10.1.4.1

Photographic film recorders are not approved.

6.10.1.5, 6.10.1.5.1, 6.10.1.5.2

Currently there are no legislative requirements to give effect to these standards.

6.10.1.6*

Australian legislation does not refer to combination recorders.

*Recommended Practice
6.10.1.7 Australian legislation does not refer to FDRs by Type. Parameters currently required to be recorded are less comprehensive than the Annex Standards.

6.10.3.1 Australian legislation does not mention FDR by Type and establishes the weight break at 29 000 kg.

6.10.5.1 The weight break is established at 29 000 kg rather than 27 000 kg.

6.10.5.2* Australia does not require non-turbine aircraft certificated before 1 July 1965 to be fitted with a CVR.

6.10.6.2* Australian legislation requires only a thirty-minute duration.

6.10.8.2 There is no requirement for operators to establish a procedure to that effect.

6.10.9 No regulatory requirement has been established.

6.10.10 Australia does not legislate for continued serviceability checks.

**CHAPTER 7**

7.1.5 The requirement for 121.5 MHz is not specifically mandated.

7.2.4 Australian legislation allows carriage of a single radio navigation aid if the aeroplane is operating outside controlled airspace.

---

*Recommended Practice*
CHAPTER 6

6.2.1 b) Not applied for aeroplanes operating above the territory of the Czech Republic for which the Certificate of Airworthiness was issued for the first time before 31 December 1997.

6.7 a) The following requirements are not applied for night flights:

a) a means of indicating in the flight crew compartment the outside air temperature; or

b) the requirements of 6.6 e), f) and g) being met by combinations of instruments or by integrated flight director systems.
CHAPTER 1

Definitions

Approach and landing operations using instrument approach procedures. Category II (CAT II) operation. A Category II operation is defined with a runway visual range of not less than 300 m.

CHAPTER 4

4.6.2.2 Planning an IFR flight with no destination alternate aerodrome is not part of national regulation.

4.7 a) and b) A destination alternate is always required for IFR flights.

4.15.1 to Not part of national regulation.

4.15.3

CHAPTER 6

6.1.3.1.1 c) Not applicable for transportation of parachutists to be dropped from the aeroplane.

6.1.3.1.1 d) 4) Not part of national regulation to have visual signals for use by intercepting and intercepted aircraft.

6.1.4 Not part of national regulations.

6.3 Seaplanes are not part of national regulations.

6.5 Not part of national regulations.

6.9 Discriminant is 15 000 kg or 30 passengers.

6.10.1.5 These paragraphs will not be implemented in time due to lack of standards and an obligation to provide ample warning for workshops and operators/owners.

6.10.5

6.10.5.2* Only for aeroplanes above 5 700 kg with turbine engine(s) and for aeroplanes above 27 000 kg.

6.10.7 Not part of national regulations.

6.10.8

6.11

6.12.3 Only required over designated land areas (transiting Sonderstrom)

CHAPTER 9

9.1 Compliance with this provision is the responsibility of each individual crew member.

*Recommended Practice

30/9/02
Remark: As the earlier Finnish requirements concerning general aviation have been spread out in different Finnish Aviation Regulations in an OPS, PEL and TRG series, the direct equivalent for every paragraph of Annex 6, Part II cannot be found. New aviation regulations OPS M2-1 “Private aviation and aerial work with aeroplanes” will be issued and tentatively in force 1 April 2002.

The requirements in the new regulations are in most cases the direct standard text of Annex 6, and where there are more demanding or more detailed national regulations, the text of the earlier national regulation has been used. These new regulations will cancel the earlier differences, but some differences will still exist and will be notified when the regulations are finalized.
CHAPTER 4

4.4.2* France has no particular requirements concerning the climb gradient other than those contained in the flight manual.

4.6.2.2 France does not require the existence of an instrument approach procedure for isolated aerodromes with no alternate aerodrome.

4.6.3.1 France has no particular requirement concerning the continuation of the flight as being dependent upon the meteorological conditions at the destination or alternate aerodrome.

CHAPTER 6

6.1.3.1.1 France requires light aeroplanes (maximum certificated take-off mass below 5 700 kg and a maximum passenger capacity of nine) to carry first-aid kits only on flights over water or designated areas, and does not require carriage of an extinguisher. The carriage of electrical fuses is required only for night flights.

6.1.3.1.2* France requires carriage of the ground-air signal codes used for search and rescue only on flights over designated land areas.

6.1.3.1.3* France does not require a safety harness for old aeroplanes (those manufactured before 1983).

6.2.1 France does not require carriage of a timepiece on VFR flights.

6.2.2* France has no particular requirements for controlled VFR flights other than compliance with ATC requirements.

6.7 France does not require aeroplanes flying VFR at night to be equipped with a timepiece, a thermometer or pitot anti-icing. There is no requirement for passenger cabin lighting either.

6.9.2* Not implemented.

6.10.1.5 French regulations do not yet include requirements for the recording of data link communications.

6.10.1.5.1 Not implemented.

6.10.1.5.2

6.10.1.7 The list of parameters required under French regulations is not in complete compliance with the requirements of Annex 6.

6.10.3.2* France requires a Type II recorder for aeroplanes with a maximum take-off mass of 14 tonnes or over, which conducted their first flight on or after 1 January 1989. There is no requirement to record the flight path of aeroplanes with a maximum take-off mass of 14 tonnes or over, which conducted their first flight before 1 January 1989.

6.10.4 Since the list of parameters for Type IA recorders has not yet been included in French regulations, the scope of application with respect to Type IA recorders has not yet been determined.

*Recommended Practice
6.10.6.2* France requires cockpit voice recorders for aeroplanes of over 5 700 kg only if they were certificated on or after 1 April 1998.

6.10.8.1 France has no particular requirements concerning the switching off of flight recorders.

6.11 France requires a Mach number indicator only for heavy aeroplanes (maximum certificated take-off weight of over 5 700 kg or a passenger capacity of more than nine).

6.14* France has no particular requirement concerning the use of boom or throat microphones below the transition level/altitude.

CHAPTER 8

8.1.3 France permits the maintenance release to be signed by a person who is not licensed in accordance with Annex 1 for maintenance operations carried out outside an approved organization in the following cases:

a) simple maintenance; and

b) maintenance on light aircraft for which a restricted certificate that is not in accordance with Annex 8 has been issued.

In these cases, the airworthiness certificate is valid for only six months.

APPENDIX Not implemented.
CHAPTER 6

6.1.3.1.1 Germany does not yet have regulations concerning the carriage of the relevant documents but in practice the specific documents are already carried on board aircraft.

6.5 This paragraph has not yet been introduced into the national regulations of Germany.

6.10.1.3 Use of metal foil recorders was not discontinued on 1 January 1995.
Remark: With the introduction of JAR-OPS 2 and JAR-OPS 4, no differences will exist between the national regulations and practices of the Netherlands and Annex 6, Part II. However, at this date it is not certain when JAR-OPS 2 and JAR-OPS 4 will enter into service.
CHAPTER 1

Definitions

Flight crew member. A crew member assigned by an operator for duty in an aircraft during flight time as a pilot or flight engineer.

Flight time — aeroplanes. The total time from the moment the aircraft moves under its own power for the purpose of taking off until the moment it comes to rest at the end of the flight.

General aviation operation. In the New Zealand civil aviation system, the generic term “general aviation” can include commercial operations. In such cases the more stringent provision of Annex 6, Part II, as appropriate, are applied.

Pilot-in-command. In relation to any aircraft, this means the pilot responsible for the operation and safety of the aircraft.

CHAPTER 3

3.2 Duties of the pilot-in-command. The pilot-in-command of an aircraft shall:

a) be responsible for the safe operation of the aircraft in flight, the safety and well-being of all passengers and crew, and the safety of cargo carried; and

b) have final authority to control the aircraft while in command and for the maintenance of discipline by all persons on board; and

c) subject to Section 13A of the Civil Aviation Act (“Duties of Pilot-in-Command and Operator During Emergencies”), be responsible for compliance with all relevant requirements of this Act and regulations and rules made under this Act.

3.5* Not implemented.

CHAPTER 4

Not implemented.

4.6.3.1 Not implemented.

4.6.3.3 CAR 91.413 c) — Operation below DA, DH or MDA. Where a DA, DH or MDA is applicable, no pilot-in-command shall operate an aircraft at any aerodrome below the MDA, or continue an instrument approach procedure below the DA or DH prescribed in paragraph b), unless:

a) the aircraft is continuously in a position from which a descent to a landing on the intended runway can be made at a normal rate of descent using normal manoeuvres that will allow touchdown to occur within the touchdown zone of the runway of intended landing;

b) the flight visibility is not less than the visibility prescribed under Part 97 for the instrument approach procedure being used; and

*Recommended Practice
c) except for a Category II or Category III precision approach procedure prescribed under Part 97 for that aerodrome that includes any necessary visual reference requirements, at least one of the following visual references for the intended runway is distinctly visible and identifiable to the pilot:

1) the approach lighting system; or
2) the threshold markings; or
3) the threshold lights; or
4) the runway-end identification lights; or
5) the visual approach slope indicator; or
6) the touchdown zone or touchdown zone markings; or
7) the touchdown zone lights; or
8) the runway or runway markings; or
9) the runway lights.

d) Landing. A pilot-in-command shall not land an aircraft when the flight visibility is less than the visibility prescribed under Part 97 for the instrument approach procedure used.

e) Missed approach procedures. Each pilot-in-command shall immediately execute the missed approach procedure prescribed under Part 97 if:

1) the requirements of paragraph c) are not met at either of the following times:
   i) when the aircraft is being operated below MDA; or
   ii) upon arrival at the missed approach point, including a DA or DH where a DA or DH is specified and its use is required, and any time after that until touchdown; or
2) an identifiable part of the aerodrome is not distinctly visible to the pilot during a circling manoeuvre at or above MDA, unless the inability to see an identifiable part of the aerodrome results only from normal manoeuvring of the aircraft during approach.

CHAPTER 8

8.1 In the context of the New Zealand Civil Aviation Rules, the “owner” is the “operator.” NZCAR define “operator” in relation to an aircraft, as the person flying or using the aircraft, or causing or permitting the aircraft to be flown, be used, or be in any place, whether or not the person is present with the aircraft.

8.2 The issue of Aviation Documents (Airworthiness Certificate) is a statutory function of the Director of Civil Aviation.

8.2.2 CAR 91.631 — Retention of records — provides for a period of 2 years or 6 months.

8.2.3 In the context of the New Zealand Civil Aviation Rules, the “lessee”, like the “owner”, is the operator.

*Recommended Practice
CHAPTER 9

9.1 Not implemented.
CHAPTER 1

Definitions

Emergency locator transmitter (ELT). Norwegian regulations do not contain the new definition of ELT.

Psychoactive substances. Norwegian regulations contains no definitions of psychoactive substances.

CHAPTER 4

4.3.1 Briefing card is not included among the mandatory items in the passenger briefing. Briefing cards are not generally used in general aviation.

4.10 Norwegian regulations only demand carrying oxygen and breathing equipment, not that it must be used.

4.14 The pilot-in-command is not explicitly responsible for the fitness of the flight crew members.

4.17 Not included in Norwegian regulations.

CHAPTER 6

6.1.3.1.1 d) 3) and 4) Not included in Norwegian regulations.

6.1.4 Not included in Norwegian regulations.

6.2.1 b) and c) The altimeter is not required to be of a sensitive type and no timepiece is required for VFR operations.

6.5.2 Not included in Norwegian regulations.

6.9.2* The Norwegian regulations require GPWS on aircraft with TOM exceeding 15 000 kg or more than 30 passenger seats.

6.9.4 Not included in Norwegian regulations.

6.10.1.3 Metal foil FDR recorders are still allowed.

6.10.1.5 Not included in Norwegian regulations.

6.10.1.5.1 Not included in Norwegian regulations.

6.10.8 Not included in Norwegian regulations.

6.11 Not included in Norwegian regulations.

6.13 Included from 1 January 2000.

*Recommended Practice
CHAPTER 7

7.1.2 Independence between communication equipment is not formally required for aeroplanes with MTOM exceeding 5 700 kg.

7.2.3 Not included in Norwegian regulations.

APPENDIX Not included in Norwegian regulations.
CHAPTER 4

4.13* Papua New Guinea legislation does not call up such a requirement.

4.15.3 CAR 254 only requires one pilot to have a seat belt fastened.

4.18.2* Such a requirement is not called up in CAO 20.9.

CHAPTER 6

6.1.3.1.3* CAR 254 only requires a seat belt or safety harness.

6.1.4.1 Papua New Guinea legislation does not call up such a requirement.

6.1.4.2

6.2.2* Papua New Guinea legislation does not address this category of operation and hence does not require VFR aircraft to be fitted with IFR equipment.

6.8 Papua New Guinea does not issue aeroplane noise certificates, hence this standard is not pertinent for domestic operations.

6.9.1 The current GPWS requirements is limited to aeroplanes over 15 000 kg or authorized carry more than 30 passengers.

6.9.2* 30 passengers.

6.9.5*

6.10.1.5 Papua New Guinea legislation does not call up such a requirement.

6.10.1.5.1

CHAPTER 7

7.1.2 Papua New Guinea legislation does not call up such a requirement, although CAO 20.8 addresses this issue to some extent.

7.2.2 Appropriate standards are presently being developed but are not yet addressed in legislation.

7.2.4 Papua New Guinea legislation does not call up such a requirement, although CAO 20.8 addresses this issue to some extent.

CHAPTER 8

8.2.3 Papua New Guinea legislation does not call up such a requirement.

*Recommended Practice
CHAPTER I

Definitions

Approach and landing operations using instrument approach procedures.
Category II (Cat II) operation. A Category II operation is defined as having a decision height of 30 m (100 ft) and a runway visual range of not less than 300 m.
CHAPTER 6

6.1.1 General aviation aircraft in Singapore are required to be registered in the Public Transport Category.
CHAPTER 1

Definitions

Night. The hours between sunset and sunrise.
CHAPTER 1

Definitions

Aerodrome operating minima. Not explicitly defined, but partly covered by other definitions.

Approach and landing operations using instrument approach procedures. Not explicitly defined, but partly covered by other definitions. Will be reconsidered in 2002.

Approach and landing operations with vertical guidance. Not defined.

Decision altitude (DA) or decision height (DH). Only precision approach is included in the definition.

Maintenance programme. Not explicitly defined, but partly covered by other definitions.

CHAPTER 4

4.3.1 Briefing card is not included among the mandatory items in the passenger briefing.

4.10 Swedish regulations only demand carrying of oxygen and breathing equipment, not that it must be used.

4.14 The pilot-in-command is not explicitly responsible for the fitness of the flight crew members.

4.17 Not included in the Swedish regulations.

CHAPTER 6

6.1.3.1.1 b) Partly covered.

6.1.3.1.1 d) 3 Not included in Swedish regulations.
and 4)
6.1.4.1
6.1.4.2

6.2.1 b) and c) The altimeter is not required to be of a sensitive type and no timepiece is required for VFR operations.

6.5.2 Not included in Swedish regulations.

6.9.1 The Swedish regulations requires GPWS on aircraft with TOM exceeding 15 000 kg or more than 30 passenger seats.

6.10.1.3 Metal foil FDR recorders are still allowed.

6.10.1.4* Not included in Swedish regulations.
6.10.1.4.1
6.10.1.5

6.10.1.7 Partly covered.
6.10.1.7.1 to Partly covered.

6.10.4 Not included in Swedish regulations.
6.10.6.3
6.10.8
6.11

CHAPTER 7

7.1.2 Independence between communication equipment is not formally required for aeroplanes with MTOM exceeding 5 700 kg.

CHAPTER 8

8.2.2 No 90-day requirement after permanent withdrawal of unit from service.
8.2.3 Not included in Swedish regulations.
CHAPTER 1

Definitions

Pilot-in-command. In United Kingdom legislation, “pilot-in-command” in relation to an aircraft means a person who for the time being is in charge of the piloting of the aircraft without being under the direction of any other pilot in the aircraft.

CHAPTER 4

4.6.2.2 The commander of the aircraft must be satisfied before flight that the flight can be safely made, taking into account the weather reports and forecasts and any alternative course of action in case the flight cannot be completed as planned.

4.6.3.1 The requirement to discontinue the flight towards the destination is not mandated.

4.7 The requirement to specify an alternate aerodrome in IFR flight plan is not mandated.

4.9 Oxygen requirements are not mandated.

4.10 Oxygen requirements are not mandated.

CHAPTER 6

6.1.1 The following are not required to be approved: maps, charts and codes; first aid equipment; timepieces; torches; whistles; sea anchors; rocket signals; equipment for mooring, anchoring and manoeuvring on water; paddles; food and water; stove, cooking utensils, snow shovels, ice saws, sleeping bags, arctic suits; and megaphones.

6.1.3.1.1 a), b) and c) 1) The requirements for first aid kit, fire extinguisher and seats are not mandated for all types of flight.

6.1.4.1 The method of marking break-in areas may differ.

6.1.4.2 The method of marking break-in areas may differ.

6.3.1 Seaplane special equipment is not mandated.

6.3.3 United Kingdom relies on provision of guidance material. United Kingdom recommendations on life jackets and rafts provide a higher level of safety.

6.4 Signalling devices and life-saving equipment are not mandated for areas where search and rescue would be especially difficult.

6.7 c), e) and f) Landing light, passenger compartment lights and torches for each crew member station are not mandated.

6.10.1.4.1 Use of photographic film flight data recorders has not been prohibited from 1 January 2003.

6.10.1.5 The requirements for recording, correlation and duration of data link communications are not mandated for new aeroplanes from 1 January 2005.

6.10.1.5.1 The requirements for recording, correlation and duration of data link communications are not mandated for new aeroplanes from 1 January 2007.
6.10.1.5.2 The requirement to record the content and time of data link messages is not mandated.

6.10.1.7 The parameters for Type IA flight data recorders are not specified in United Kingdom regulatory material.

6.10.3.1 The requirement for Type I flight data recorders over 27 000 kg is not mandated for all C of A categories.

6.10.4 The requirement for Type IA flight data recorders in new aeroplanes over 5 700 kg from 1 January 2005 is not mandated.

6.10.5.1 The requirements for cockpit voice recorders over 27 000 kg are not mandated for all C of A categories.

6.10.6.3 The requirement for the cockpit voice recorder in new aeroplanes over 5 700 kg from 1 January 2003 to retain the last two hours information is not mandated.

6.12.1 The ELT requirements applicable until 1 January 2005 for extended flights over water and the designated land areas as described in 6.4 are not mandated.

6.12.2 The automatic ELT requirements for extended flights over water and the designated land areas as described in 6.4 are not mandated for new aeroplanes from 1 January 2002.

6.12.3 The automatic ELT requirements for extended flights over water and the designated land areas as described in 6.4 are not mandated for all aeroplanes from 1 January 2005.

6.13.1 Partially implemented. United Kingdom requires pressure-altitude reporting transponder for flight in designated airspace.

6.13.2* The recommendation that all aeroplanes should be equipped with a pressure-altitude reporting transponder is not implemented.

CHAPTER 7

7.1.1 United Kingdom requires radio communication equipment for IFR flight in controlled and notified airspace. Gliders are excepted.

7.1.4 Radio communication equipment capable of communicating on prescribed frequencies is not mandated for extended flights over water and the designated land areas as described in 6.4.

CHAPTER 8

8.1.1 The operator is responsible for maintenance.

8.2.1 The operator is responsible for maintenance.

8.3 The operator is responsible for maintenance.

*Recommended Practice

30/9/02
GENERAL
The United States does not accept any provision of Annexes 2, 6, 10 or 11 or any other Annex as a Standard or Recommended Practice as applicable to State aircraft. In accordance with Article 3(a) of the Convention on International Civil Aviation, the Convention and its Annexes are not applicable to State aircraft. In so far as any provisions of Annexes 2, 6, 10 or 11 address the operation or control of State aircraft, the United States considers such provisions to be in the nature of a special recommendation of the Council, advisory only, and not requiring the filing of differences under Article 38 of the Convention.

CHAPTER 1
Definitions
Note.—The United States expresses distances in terms of feet and miles rather than metres. A significant number of North American operators and aircraft are not equipped with metric unit displays.

Approach and landing operations using instrument approach procedures.
Category I (CAT I) operation. For a Category I operation, the United States requires a decision height (DH) of not less than 200 ft (60 m) and either visibility of not less than one-half mile (800 m) or a runway visual range of 2 400 ft (732 m) (RVR 1 800 ft (548 m)) with operative touchdown zone and runway centre line lights).

Category II (CAT II) operation. The United States requires that Category II provide approaches to minima of less than 200 ft (60 m) decision height/2 400 ft (732 km) runway visual range to as low as 100 ft (30 m) decision height/1 200 ft (365 m) runway visual range.

Category IIIB (CAT IIIB) operation. The United States criteria are the same as those adopted in Annex 6, Part II. However, the runway visual range is expressed in feet less than 700 ft (200 m) but not less than 150 ft (50 m).

Minimum descent altitude (MDA) or minimum descent height (MDH). The United States does not use the term MDH (or height above aerodrome) to describe an altitude or height in a non-precision approach or circling approach below which descent must be made without the required visual reference.

CHAPTER 3
3.5* The pilot-in-command is not required to have available on board the aeroplane information concerning search and rescue services.

CHAPTER 4
General
In addition to the flight preparation requirements of Annex 6, Part II, Chapter 4, the United States requires United States-registered large or turbine-powered multi-engine general aviation, passenger-carrying aircraft, wherever operated, to adequately secure and stow food, beverage, and passenger service equipment during aircraft movement on the surface, take-off, and landing.

4.3.1 Except for large and turbine-powered multi-engine aeroplanes, the United States does not require the pilot-in-command to ensure that crew members and passengers are familiar with the location and use of emergency exits, life jackets, oxygen dispensing equipment or other emergency equipment provided for individual use.

*Recommended Practice
4.3.2 Except for large and turbine-powered multi-engine aeroplanes, the United States does not require the pilot-in-command to ensure that all persons on board are aware of the location and general manner of use of the principal emergency equipment carried for collective use.

4.6.2.1 The United States does not require a destination alternate aerodrome when the weather at the aerodrome of intended landing is forecast to have a ceiling of at least 2 000 ft (600 m) and a visibility of at least 3 miles (4.8 km). In addition, standard alternate aerodrome minima are prescribed 600 ft (185 m) ceiling and 2 miles (3.2 km) visibility for precision approaches, and 800-ft (243 m) ceiling and 2 miles (3.2 km) visibility for non-precision approaches.

4.6.2.2 b) [Continued]

Under United States regulations, the forecast period for the destination alternate aerodrome is from one hour before to one hour after the estimated time of arrival. In addition, the minima for ceiling/visibility at the aerodrome of intended landing are 2 000 ft (600 m) and 3 miles (4.8 km); that is, when at least such minima exist, no alternate aerodrome is required.

4.6.4 In addition to the Standard prescribed in Annex 6, Part II, 4.6.4, the United States prohibits a pilot from taking off a United States-registered large or turbine-powered multi-engine general aviation aeroplane if there is frost, snow, or ice adhering to critical systems, components and surfaces of the aircraft.

4.11 The pilot-in-command is not required to ensure that all persons on board the aircraft during an emergency are instructed in emergency procedures.

4.17 The United States does not specify the authority, qualifications or competency of persons permitted to taxi aeroplanes on the movement area of an aerodrome.

4.18.1* The United States has no provisions concerning aircraft refuelling with passengers on board.

4.18.2* CHAPTER 6

General In addition to the aeroplane instruments and equipment standards prescribed in Annex 6, Part II, Chapter 6, the United States requires that all United States-registered turbojet-powered aeroplanes wherever operated be equipped with an altitude alerting system or device. The United States also requires that all transport category aeroplanes used in air commerce in the United States and all United States-registered transport category aeroplanes used in air commerce outside the United States must use an aural speed warning device.

6.1.3 The United States requires that all large and turbine powered multi-engine general aviation aircraft of United States registry have the following emergency equipment in addition to the equipment specified in Annex 6, Part II, 6.1.3: two fire extinguishers in the passenger compartment of aircraft accommodating 30 or more passengers; a crash ax for aeroplanes accommodating more than 19 passengers; a portable megaphone for aeroplanes seating more than 60 but less than 100 passengers; and two megaphones for aeroplanes with a seating capacity of more than 100 passengers.

6.1.3.1.1 The United States does not require all aeroplanes to be equipped with: a first-aid kit; portable fire extinguishers; seat or berth for each person; current and suitable air navigation charts; or spare electrical fuses for VFR day operations.

*Recommended Practice

30/9/02
6.1.3.1.2* The United States does not require aeroplanes on all flights to be equipped with ground-air signal codes for search and rescue purposes.

6.1.3.1.3* The United States requires all aeroplanes manufactured after 12 December 1986 to be equipped with a shoulder harness for all crew member seats, in addition to the seat belt. For small civil aeroplanes manufactured after 18 July 1978, a shoulder harness and seat belt are required for the front seats only.

6.2.1 b) An accurate timepiece is not required for VFR flight.

6.2.2* The United States does not require aeroplanes on VFR flights, when operated as controlled flights, to be equipped in accordance to the requirements for aircraft operated under instrument flight rules.

6.3.1 The United States does not require all seaplanes on all flights to be equipped with one life jacket or equivalent individual flotation device for each person on board; equipment for making the sound signals prescribed in the International Regulations for Preventing Collisions at Sea; and anchor; or a sea anchor (drogue).

6.3.2.1* Life jackets or equivalent flotation devices are not required for single-engined aeroplanes flying over water beyond gliding distance from shore unless flying for hire, in which case this equipment and pyrotechnic devices are required.

6.3.3 a) Only large and turbine-powered multi-engine aeroplanes are required to carry life preservers or an approved flotation means for each occupant of an aeroplane on a flight over water more than 50 NM (93 km) from the nearest shore.

6.3.3 b) Only large and turbine-powered multi-engine aeroplanes on flights over water more than 30 minutes flying time or 100 NM (185 km) from the nearest shore must be equipped with life-saving rafts and pyrotechnic signalling devices.

6.4 Aeroplanes operated over land areas designated as areas in which search and rescue would be especially difficult are not required to be equipped with signaling devices or life-saving equipment. The United States does not designate areas in which search and rescue would be especially difficult, and therefore does not require such additional equipment.

6.6 d), h), i) and j) The United States does not require all aeroplanes when operated in accordance with instrument flight rules or when the aeroplane cannot be maintained in a desired altitude without reference to one or more flight instruments, to be equipped with:

a) an airspeed indicating system with a means of preventing malfunctioning due to a condensation or icing;

b) a means of indicating whether the supply of power to the gyroscopic instruments is adequate;

c) an outside air temperature indicator; or

d) a rate-of-climb and descent indicator.

*Recommended Practice
6.7 a) and c) to f) Aeroplanes operated under visual flight rules at night are not required to be equipped with:
   a) a turn and slip indicator;
   b) an attitude indicator (artificial horizon);
   c) heading indicator (directional gyroscope);
   d) a means of indicating whether the supply of power to the gyroscopic instruments is adequate;
   e) a sensitive pressure altimeter;
   f) a means of indicating the outside air temperature;
   g) a timepiece with a sweep second hand;
   h) an airspeed indicating system with a means of preventing malfunctioning due to condensation or icing;
   i) a rate-of-climb and descent indicator;
   j) a landing light;
   k) illumination for flight instruments and equipment;
   l) lights in passenger compartments; and
   m) a flashlight (electric torch) for each crew member station.

6.9.1 to 6.9.5* Ground proximity warning systems are not required on general aviation aircraft, including turbine-engined aeroplanes with a take-off weight greater than 5 700 kg or capable of carrying more than nine passengers.

6.10.3.1 The United States does not base requirements for flight data recorders on aircraft weight, but on passenger and engine configuration.

6.10.3.2* The United States does not base requirements for cockpit voice recorders on aircraft weight, but on passenger and engine configuration.

6.10.9 The United States does not have a specific regulation that requires operational checks and evaluations of recordings from the flight data recorder and cockpit voice recorder to ensure continued serviceability of the recorders. However, the United States does require this maintenance function be carried out as part of the instructions for continued airworthiness.

6.12 All United States-registered aeroplanes are required to be equipped with an ELT meeting TSO-C91 design standard installation, and battery use requirements, except that the United States does not require an emergency locator transmitter for:
   a) turbojet-powered aircraft;
   b) aircraft operated in scheduled flights by scheduled air carriers;

*Recommended Practice
c) aircraft operated in training operations within a 50-NM (93 km) radius of the aerodrome from which such local flight operations began;

d) flight operations incident to design and testing;

e) new aircraft while engaged in flight operations incident to their manufacture, preparation, and delivery;

f) agricultural aircraft operations;

g) aircraft for research and development purposes;

h) aircraft showing compliance with regulations, crew training, exhibition, air racing, or market surveys; or

i) aircraft equipped to carry not more than one person.

The United States requirement for the installation of an ELT does not make a distinction for extended flights over water or flights over designated land areas.

6.14* The United States does not require crew members on flight deck duty to communicate through boom or throat microphones below the transition level/altitude.

CHAPTER 7

7.1.1 Except when operating under controlled flight, aeroplanes operated at night are not required to have radio communications equipment capable of conducting two-way communications. United States requirements for radio communications equipment are based upon the type of airspace in which the operation occurs, and not on the time of day.

7.1.2 When more than one radio communications equipment unit is required, the United States has no provision that each unit be independent of any other.

7.1.4 Except when operating under controlled flight, aeroplanes on extended flights over water or on flights over underdeveloped land are not required to have radio communications equipment capable of conducting two-way communications.

7.2.1 The United States has no provisions concerning required aircraft navigation instruments enabling a flight to proceed in accordance with a flight plan, prescribed RNP types, or the air traffic services provided. The United States does not specify a minimum distance between landmark references used by flights operating under visual flight rules.

7.2.4 Aeroplanes are not required to have navigation equipment to ensure that, in the event of the failure of one item of equipment at any stage of the flight, the remaining equipment will enable the aeroplane to proceed in accordance with Annex 6, Part II, paragraph 7.2.1 through 7.2.3.

*Recommended Practice
CHAPTER 8

8.2.2 The United States does not require records to be maintained after the end of the operating life of the unit.

CHAPTER 9 The pilot-in-command is not required to ensure that the licenses of each flight crew member have been issued or rendered valid by the State of Registry and are properly rated and of current validity; and to be satisfied that flight crew members have maintained competence.
